# Geo-spatial /GEO-ICT

**ICT** is an acronym that stands for Information & Communication Technology

Geospatial technology can be refer to **GEO-ICT** (Location-ICT) this including GIS, Spatial modeling and spatial data and geospatial services.

Scale is important aspect in geospatial and we can apply “**scale independent approaches**” that allow tracking of changes at any spatial domain:

Global-> National -> Basin-> Farms ->Fields -> Buildings -> Petri dish -> Cell

This kind of development gives the multi- and cross-disciplinary nature of the geospatial sciences an technology.

## **Multi-Platform Analysis /Visualization**

# UAS application components

# Agricultural UAV applications

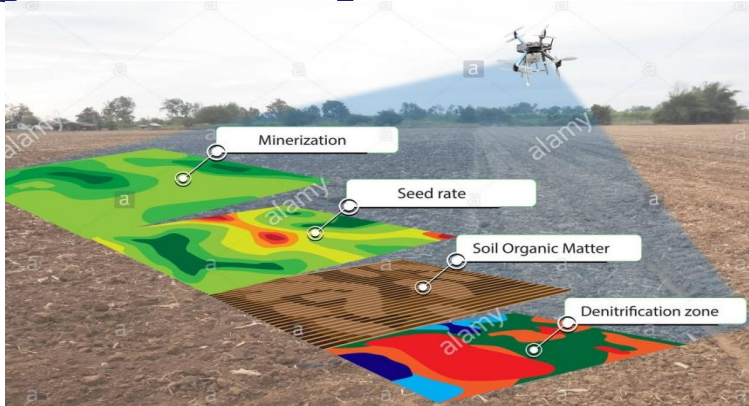

Agricultural application are in three categories:

- Agricultural optimization
- Monitoring operation
- Increase of productivity

# Agricultural optimization

Land unit mapping  
Terrain analysis for tillage operation  
Weed control

Pest control

Rangeland  
mapping/management and  
animal distribution

# Monitoring operation

- Mapping of crop types
- Monitoring of growth stages
- Weed mapping
- Water requirement
- Mapping crop stress (biotic/Abiotic)

Yield and production estimation  
Insurance index

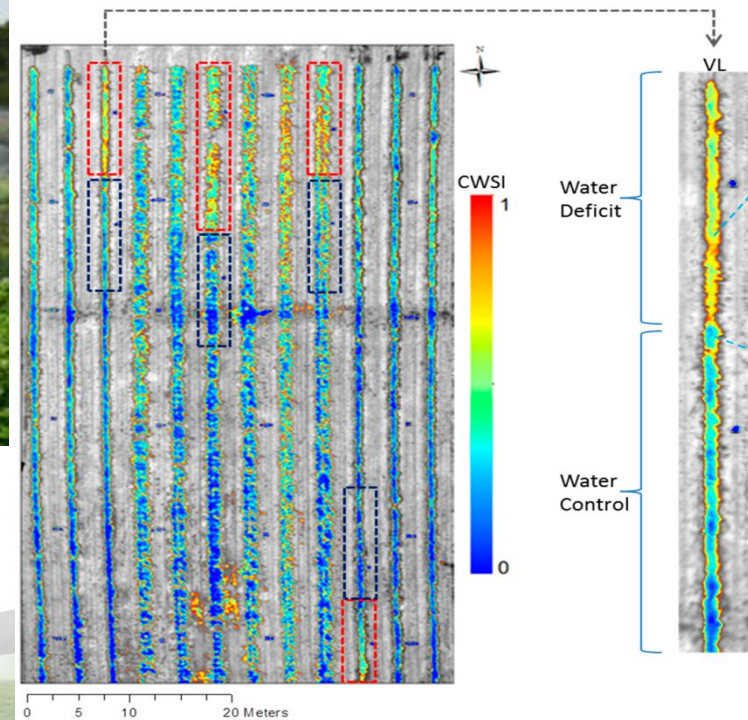

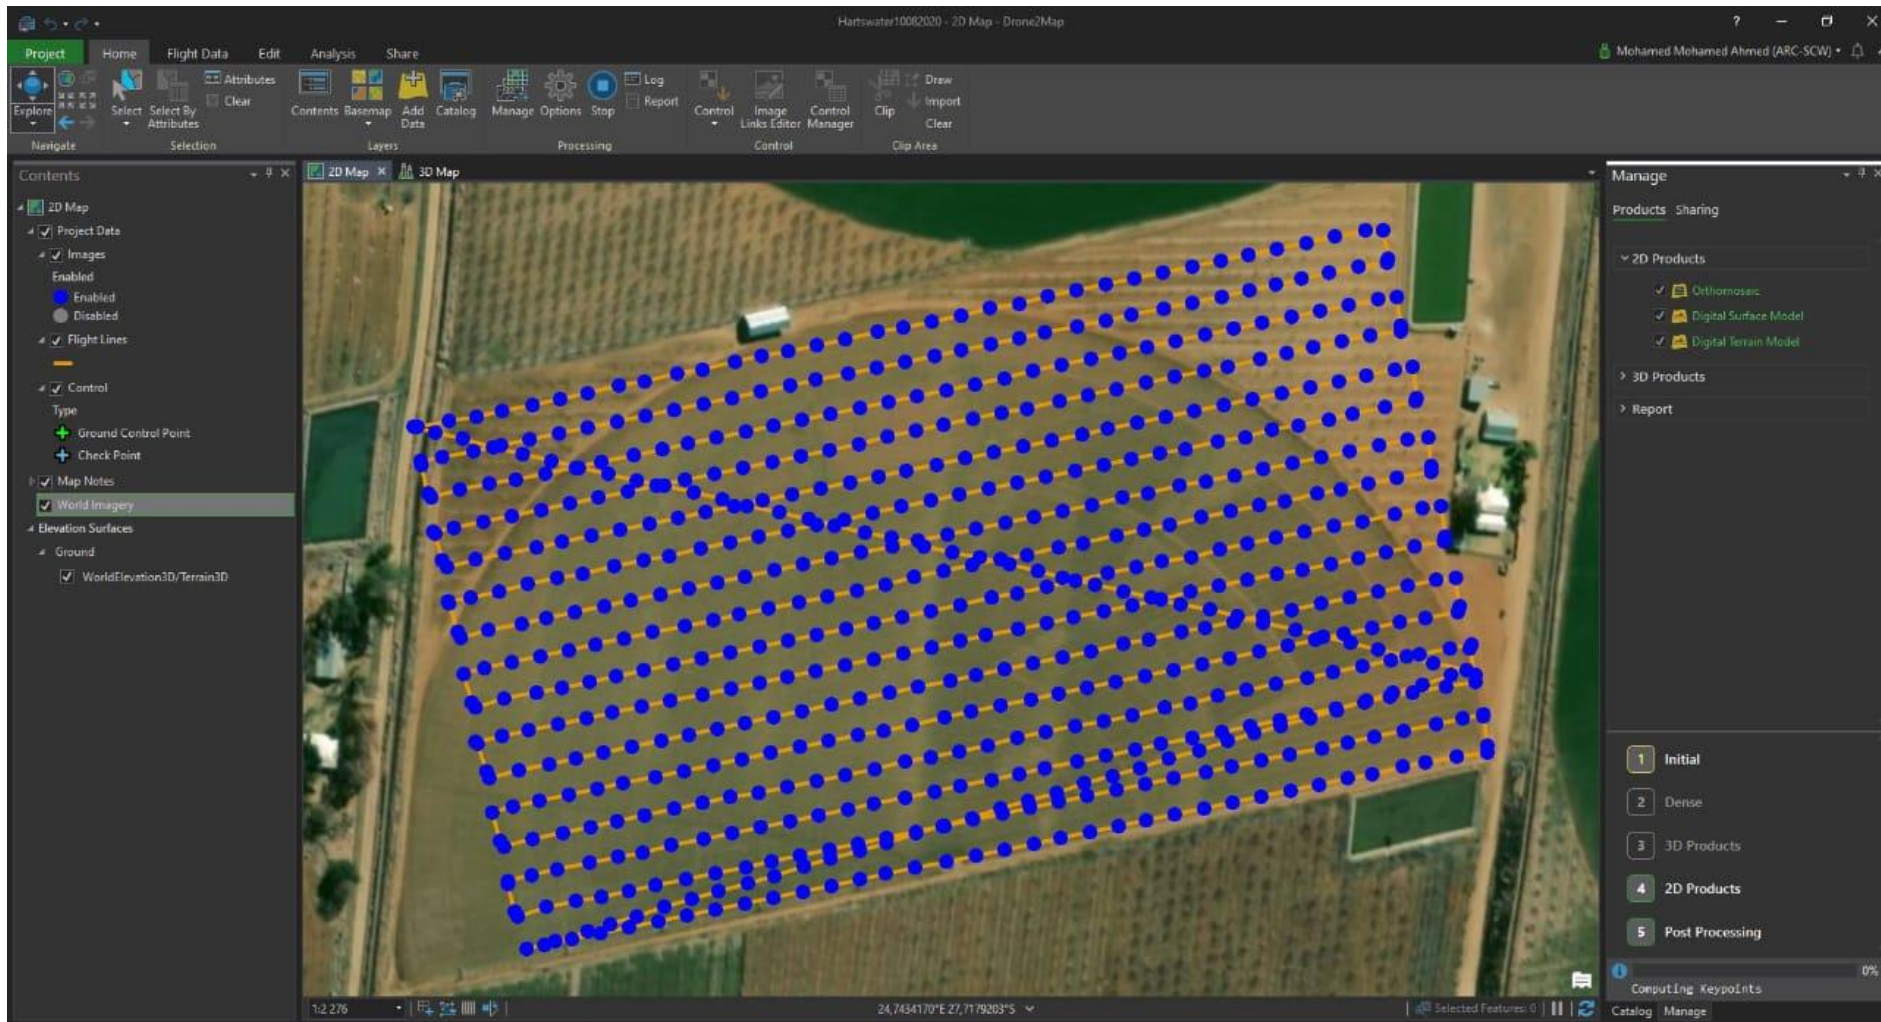

# Increase of productivity

Crop water use  
Irrigation efficiency  
Fertilizer management  
Rangeland Capacity

**Acquisition**

# Remarks:

- The rapid development in satellite/low-altitude data acquisition and cloud processing platforms make the use of these technologies much available for researchers and specialist and open many doors for high-level applications (e.g. WEF, WaPRO, LaPro,...)
- Sharing of monitoring, modeling and simulation results with end users (farmers, specialists, & decision makers) in a way that can have impact on their cultivation practices for better use of resources and maximize the productivity of the land

# THANK YOU
