# I . Background : Dynamic Korea

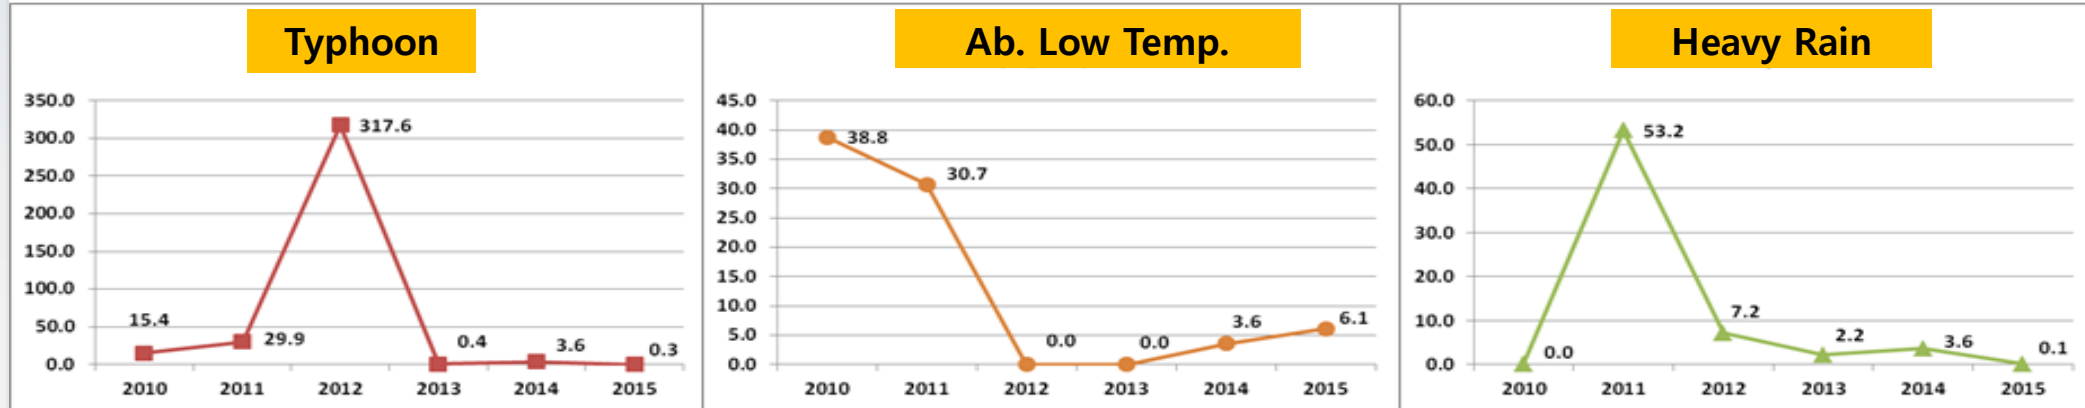

# From morning calm Korea To Dynamic Korea

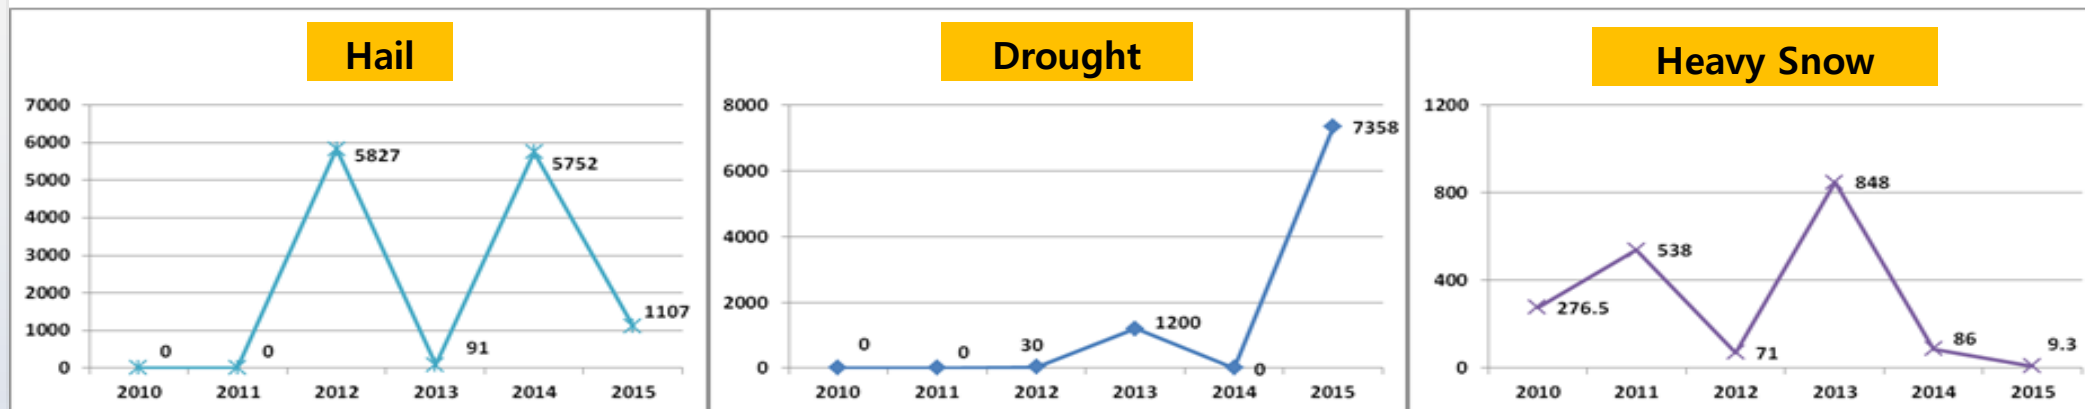

\*\* Korea has been changed from morning calm in the Eastern small country to dynamic country now. Many kinds of fields have been developing vividly such as city, shipbuilding, semiconductor, vitality of tradition, sports, K-pop, and etc. And Korean Agriculture and climate change are seemed to become dynamic. I'll show you shortly in this time.

# Changes of damaged area according to kinds of climate disasters

Unit : 1,000ha

Unit : ha

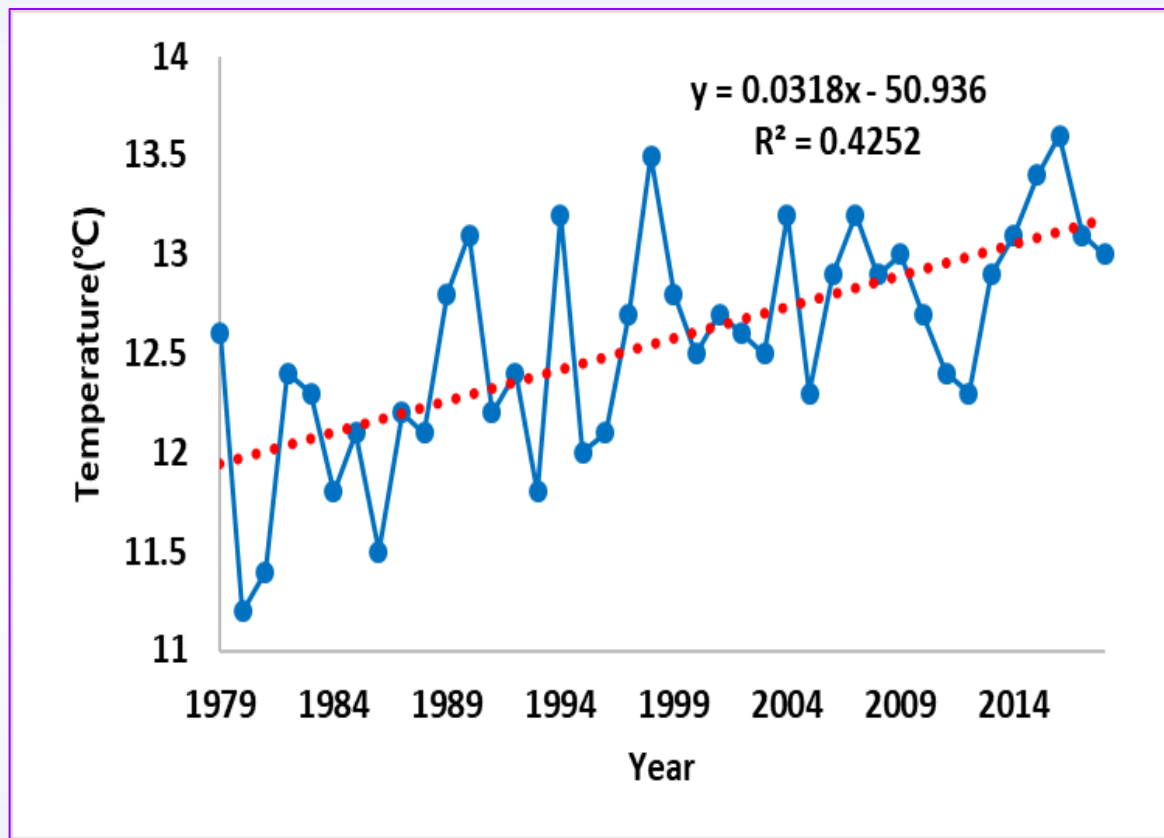

\*\* Even though Korean peninsula has very small land area, there are many kinds of climate disasters every year that it has happened in all of the world.

As you see the this figure, you can understand my words, there are typhoon, abnormal low temp, heavy rain, hail, drought, heavy snow and heat wave in summer.

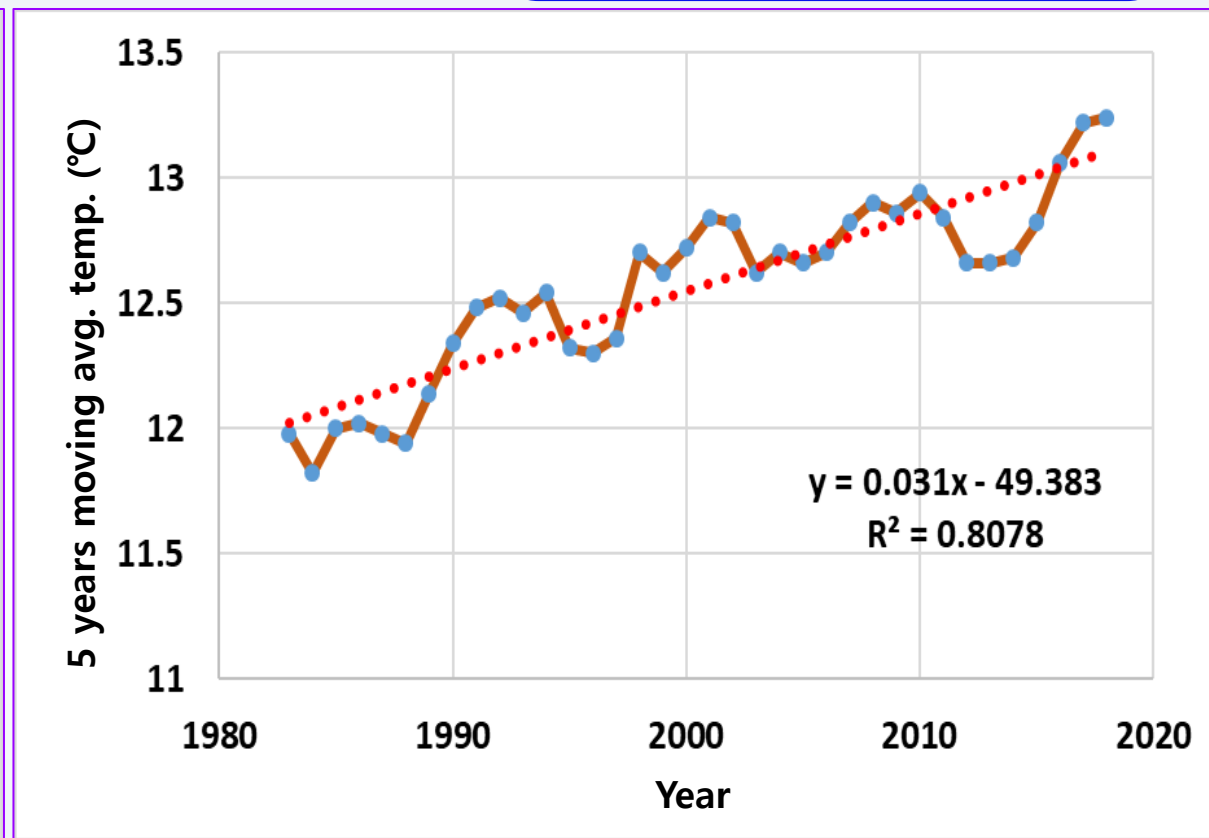

\*\* 지난 40년간 우리나라 평균기온이 연차별 변동이 있으나 꾸준히 상승추세를 만듦

# Changes of Avg. Temp. of Korea during 40 years recently

about 0.3°C/10years

Change of average temperature

Change of moving avg. temp. by 5 years

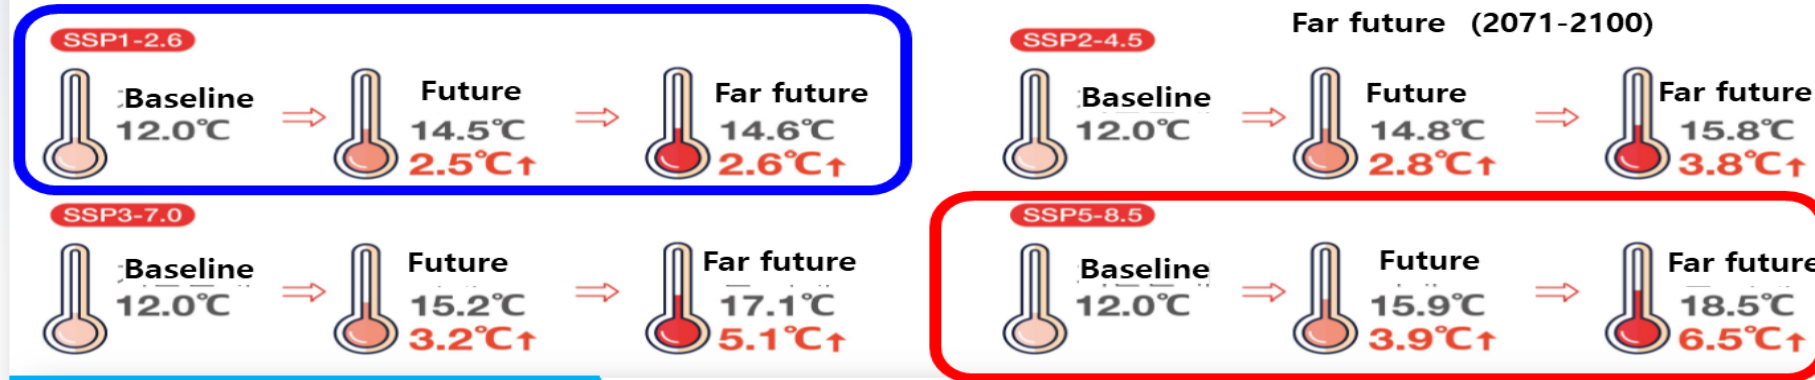

\*\* This shows the changes of avg. temp. of Korea last 40 years. Left one is just plot for average temp, and we know there are high fluctuation year by year.

right figure shows changes of moving average temp. by 5 years. We can more obviously understand the trend of Korean warming.

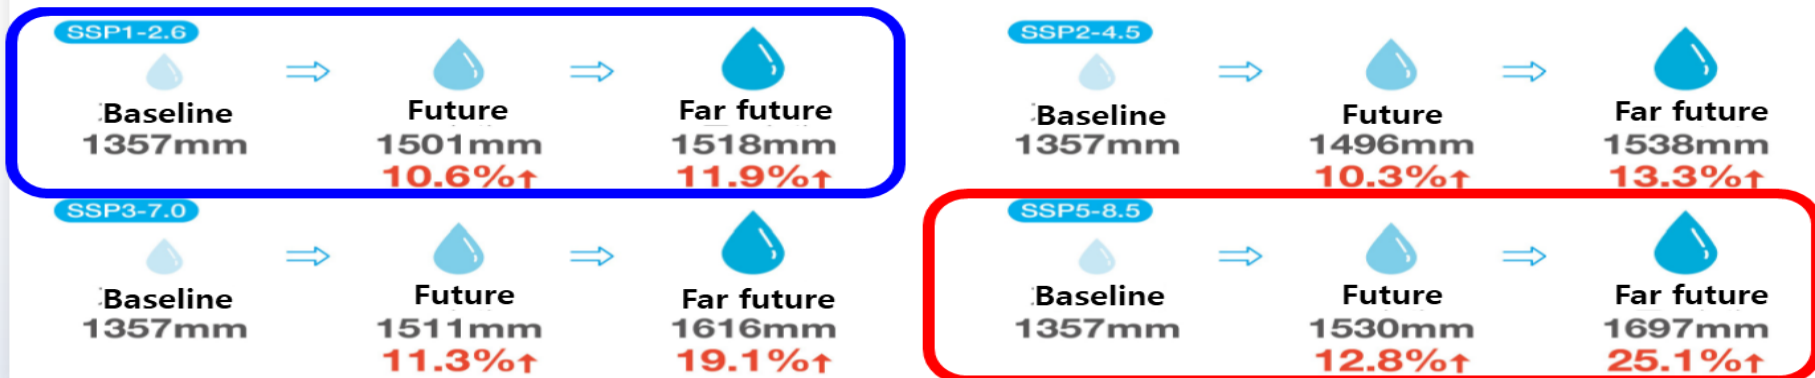

In case of Korean temp, we could have defined that Korea have being warm with rate of about 0.3°C/10 years.

# Future change of Temp. and Precipitation (SSP)

## Temperature change in Korea

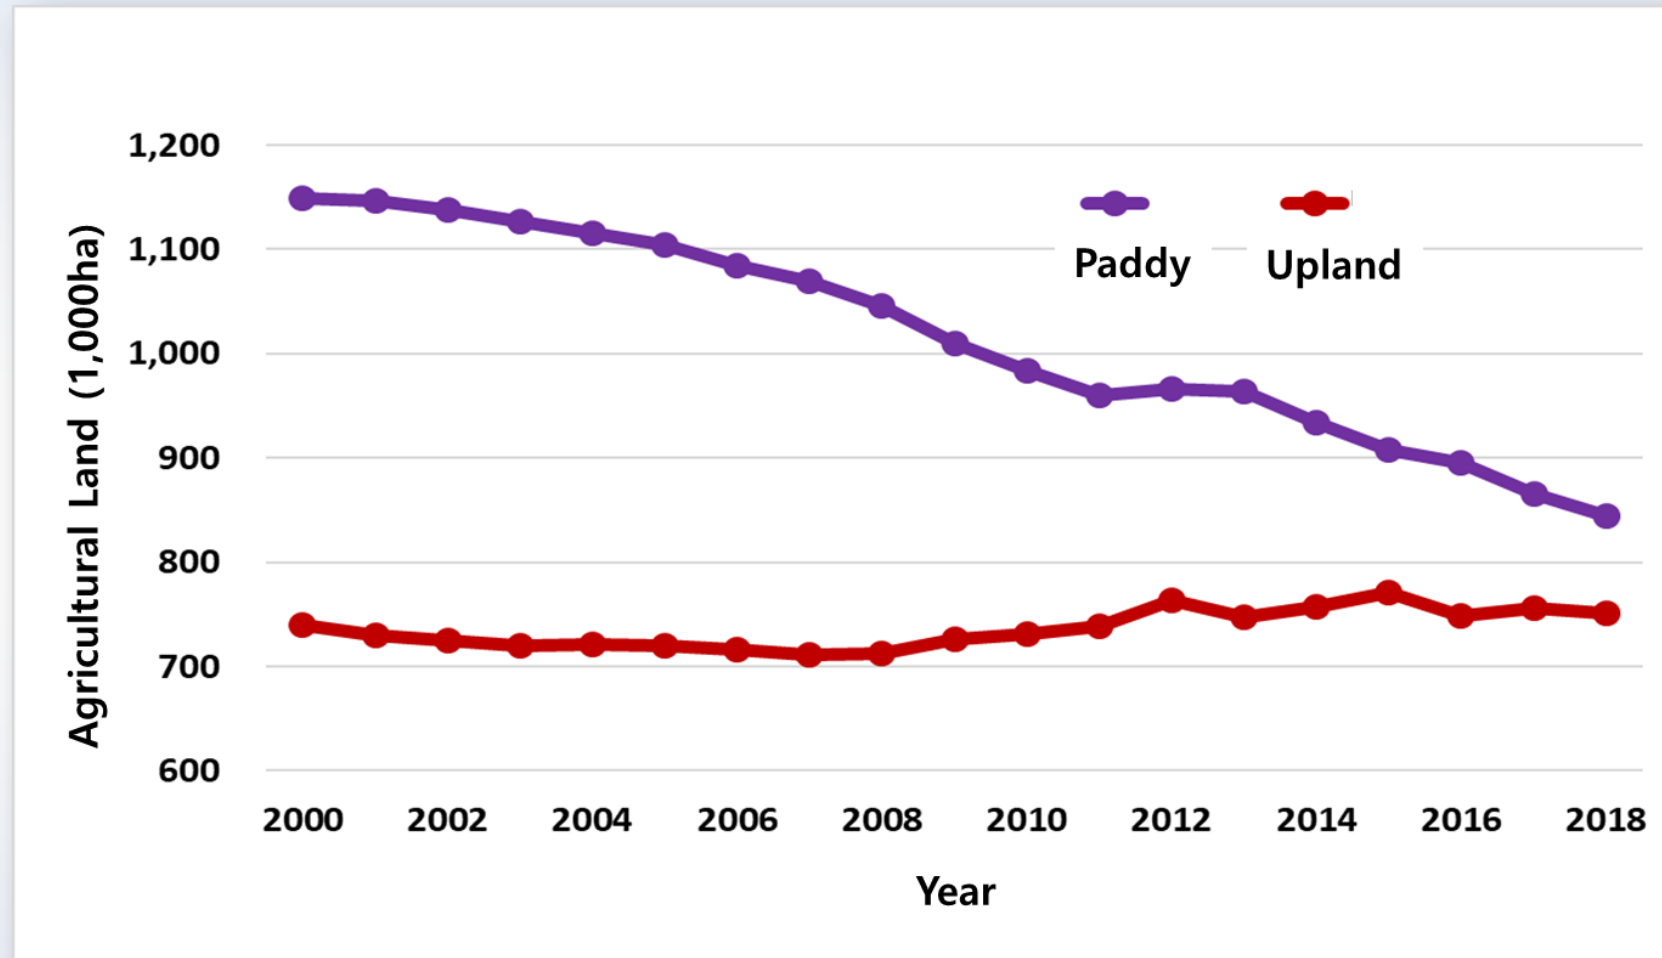

## Precipitation change in Korea

\*\* The prediction for future is not so blight as you see this figure.

Temp. in far future will be rise about 6.5 °C, and precipitation be about 25.1 % according to SSP scenario if Korea will being last circumstance with present emission.

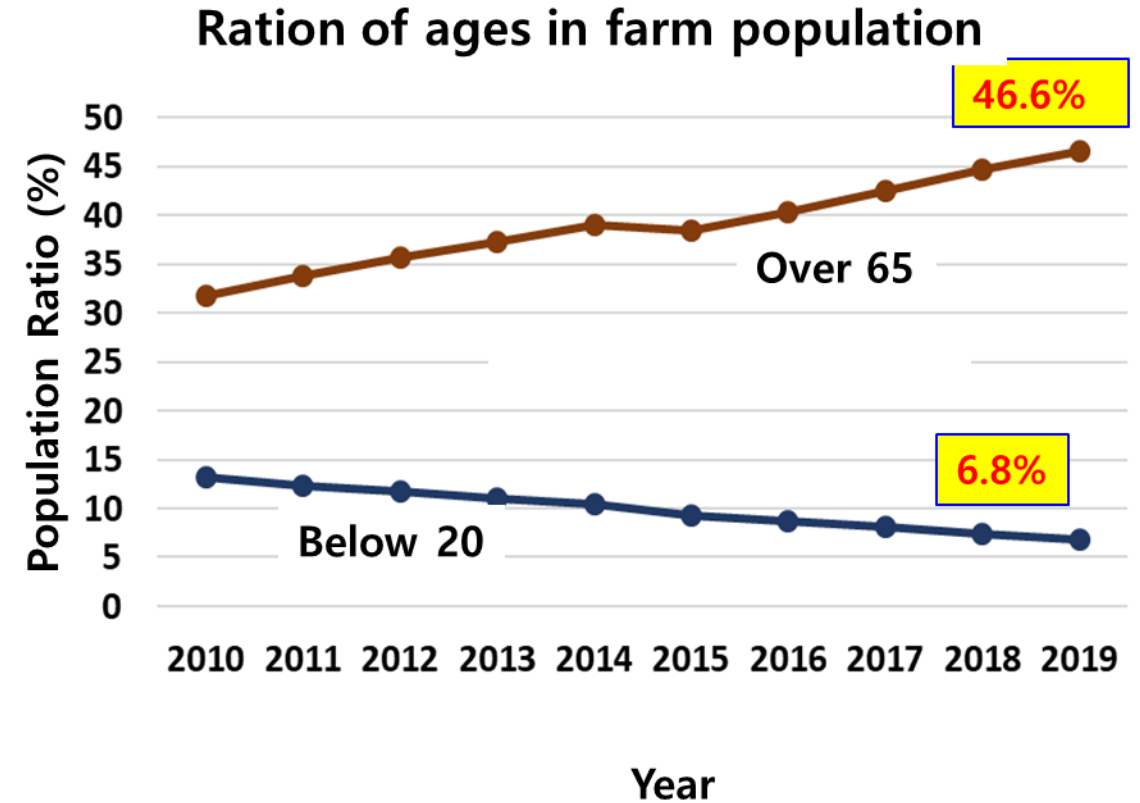

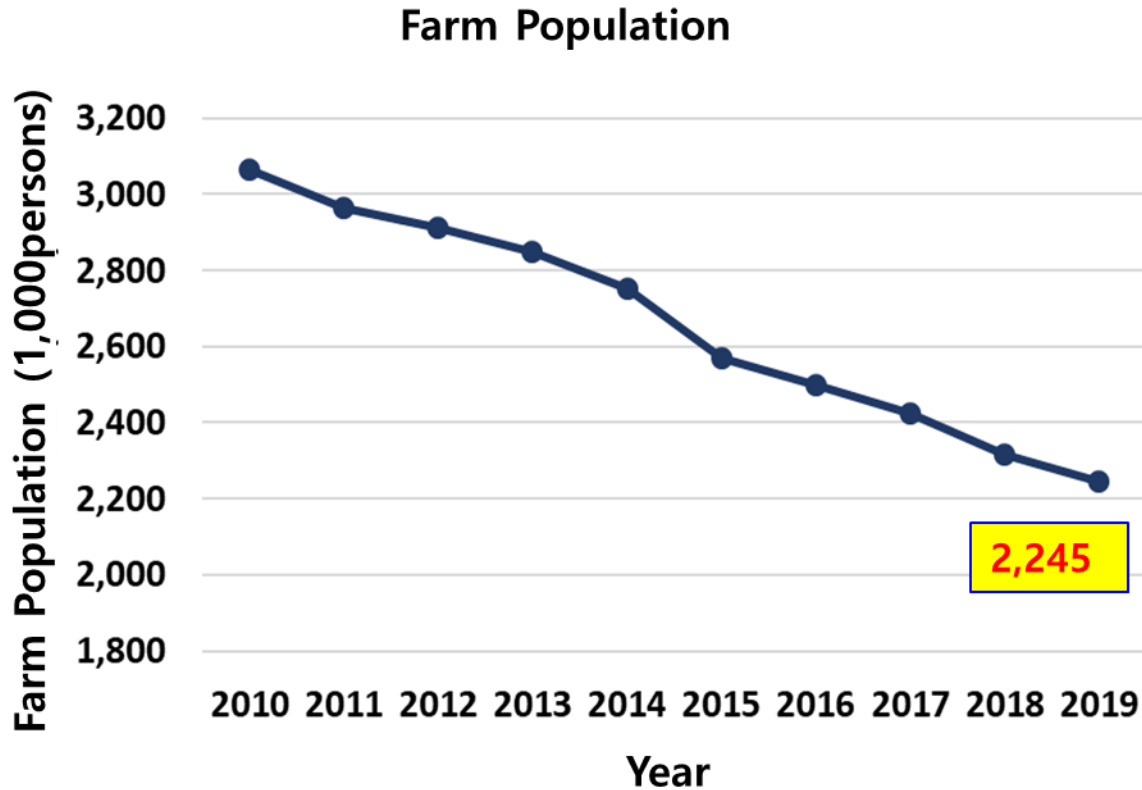

# Changes of agricultural land

\*\* Status in agricultural sector is not easy to cope with climate change.

As you see this figure, changes of agricultural land, the land area have been rapidly decreased, especially paddy fields. We has to consider food security seriously.

# Changes of farm population and ratio of ages

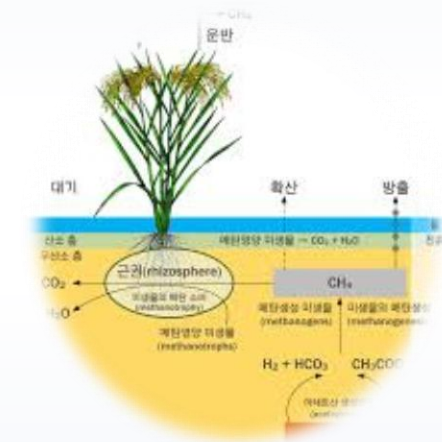

\*\* Another important issues in agricultural sector are decrease of farm population and, especially, very fast population ageing as you see.

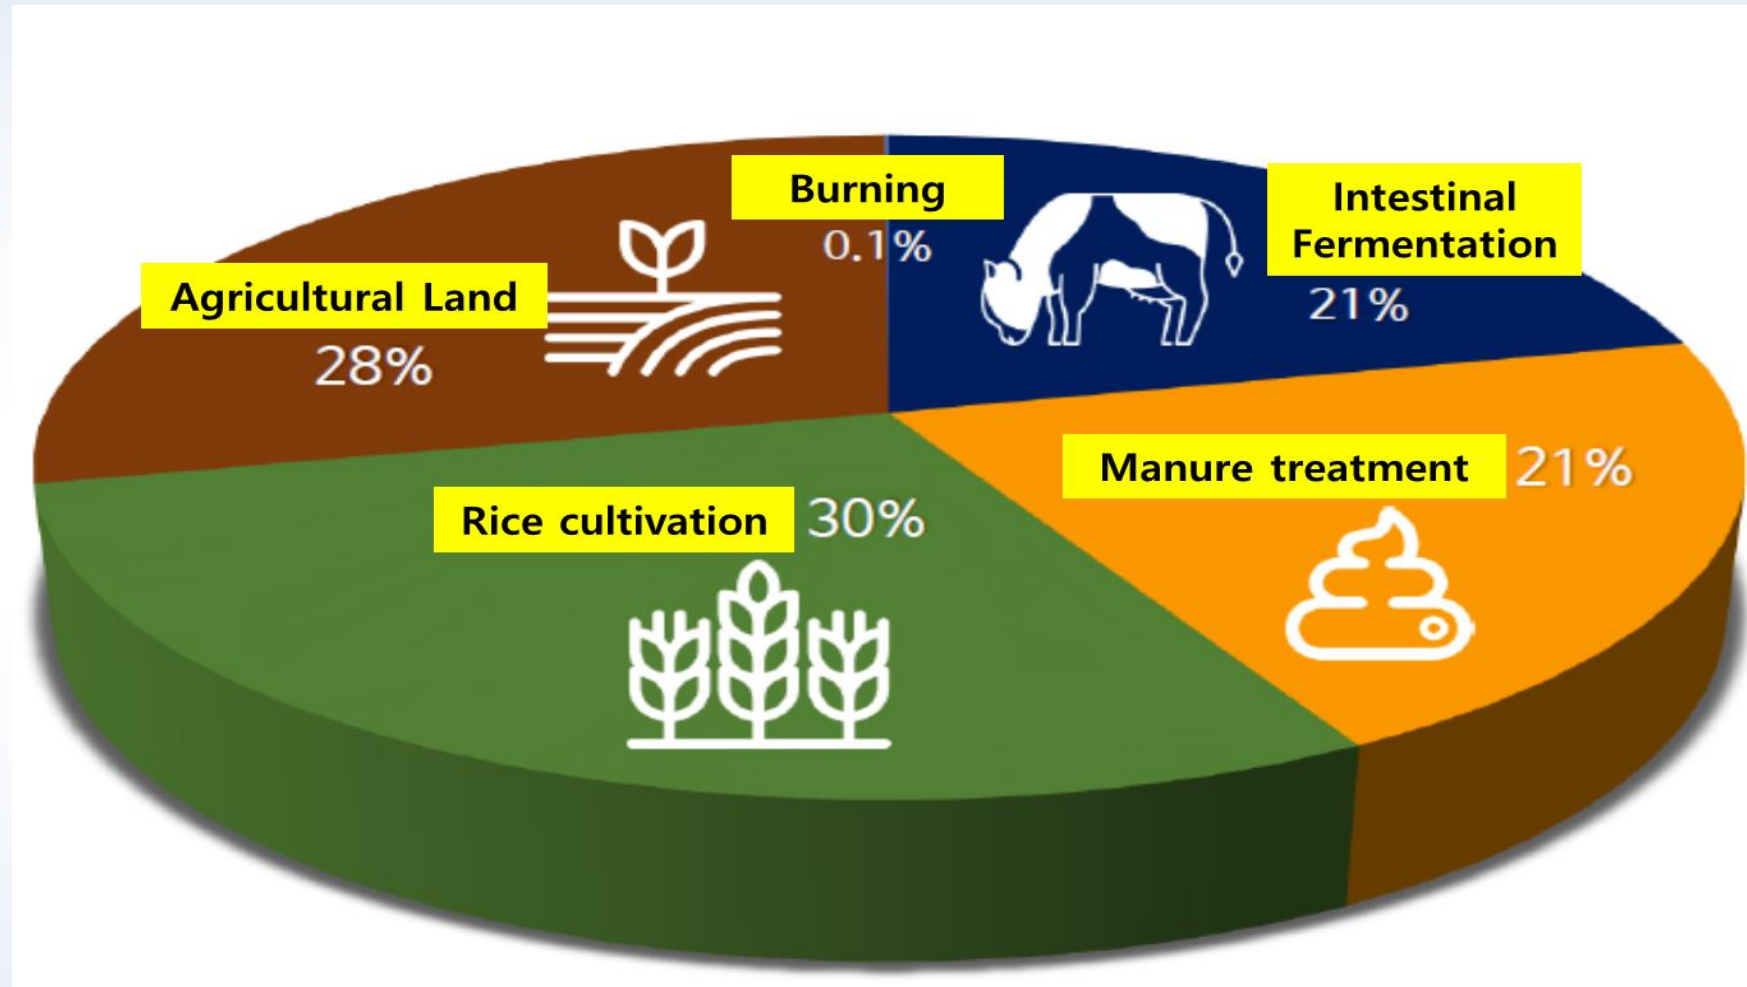

half of people in rural area is over 65. So I'm 55, looks young, but I'm called as the youth in rural area.

## II. Impact Assessment on Climate Change

# Ratio of green house gas emission in agricultural sector

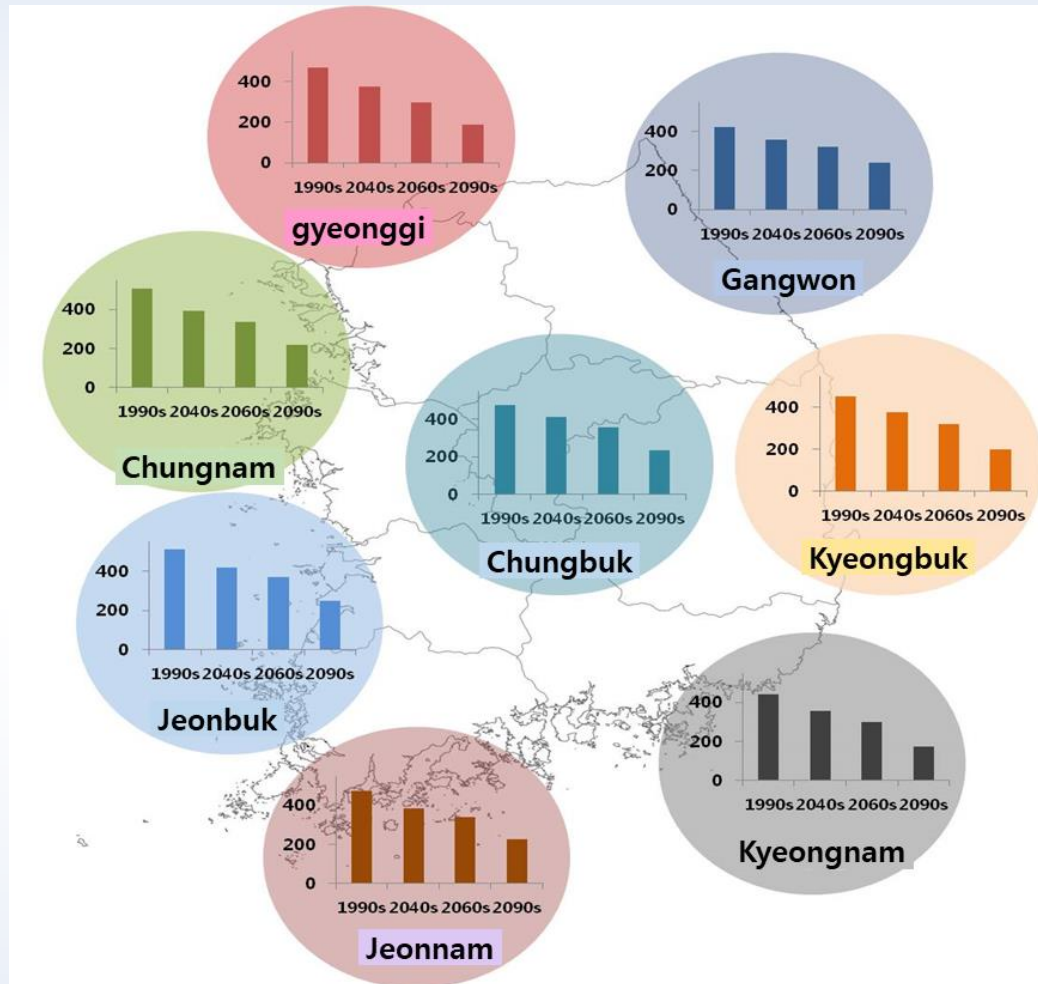

\*\* The ratio of GHG emission in agricultural sector has been only charged about 2.9% among total emission in Korea.

source of emission could be classified four categories such as agricultural land, rice cultivation at cultivation area, intestinal fermentation, manure treatment in livestock.

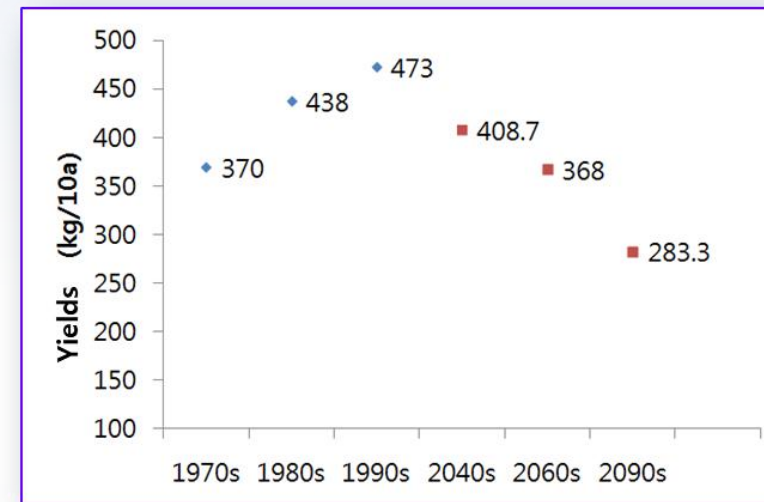

Especially, methane emission at rice cultivation and intestinal fermentation has been issued in Korea.

# Prediction of rice production according to RCP8.5 scenario

'16, NICS

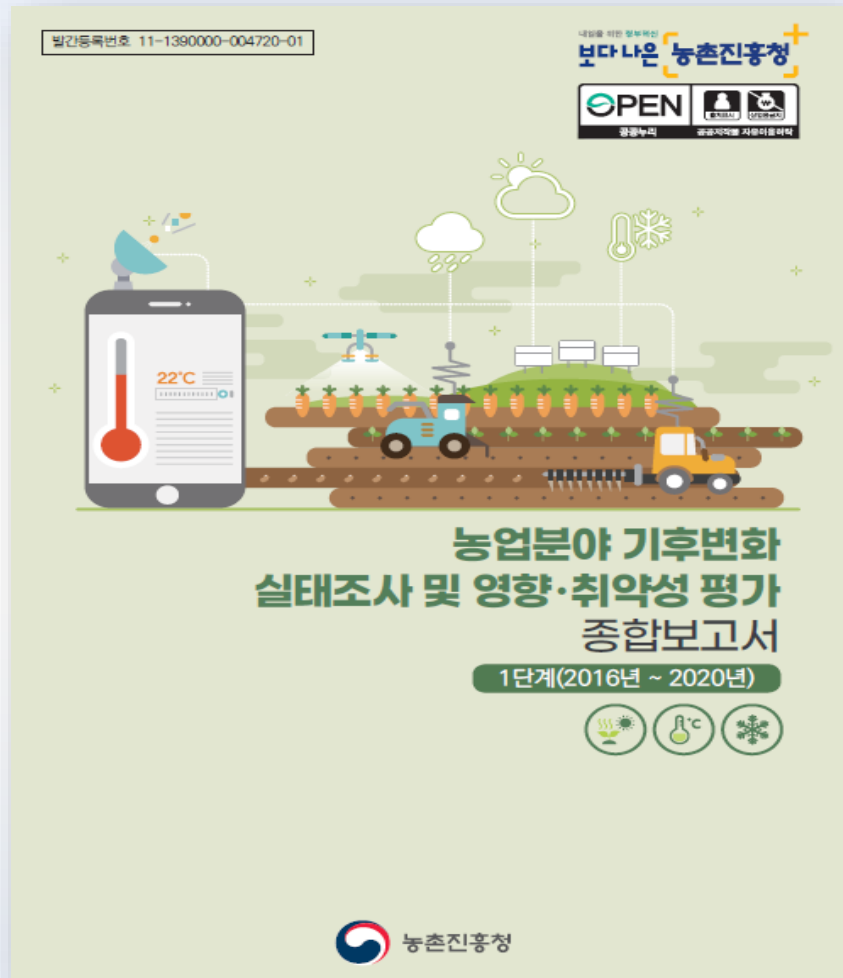

ORYZA2000, RCP8.5 scenario

\*\* When we cultivate rice with present varieties and same practice, it is projected there will decrease rice production from 2040's and become expand their loss as time goes.  
As you see this slide figure, all of province in Korea shows very similar trends of decrease.

# Report on survey of climate change and vulnerability assessment

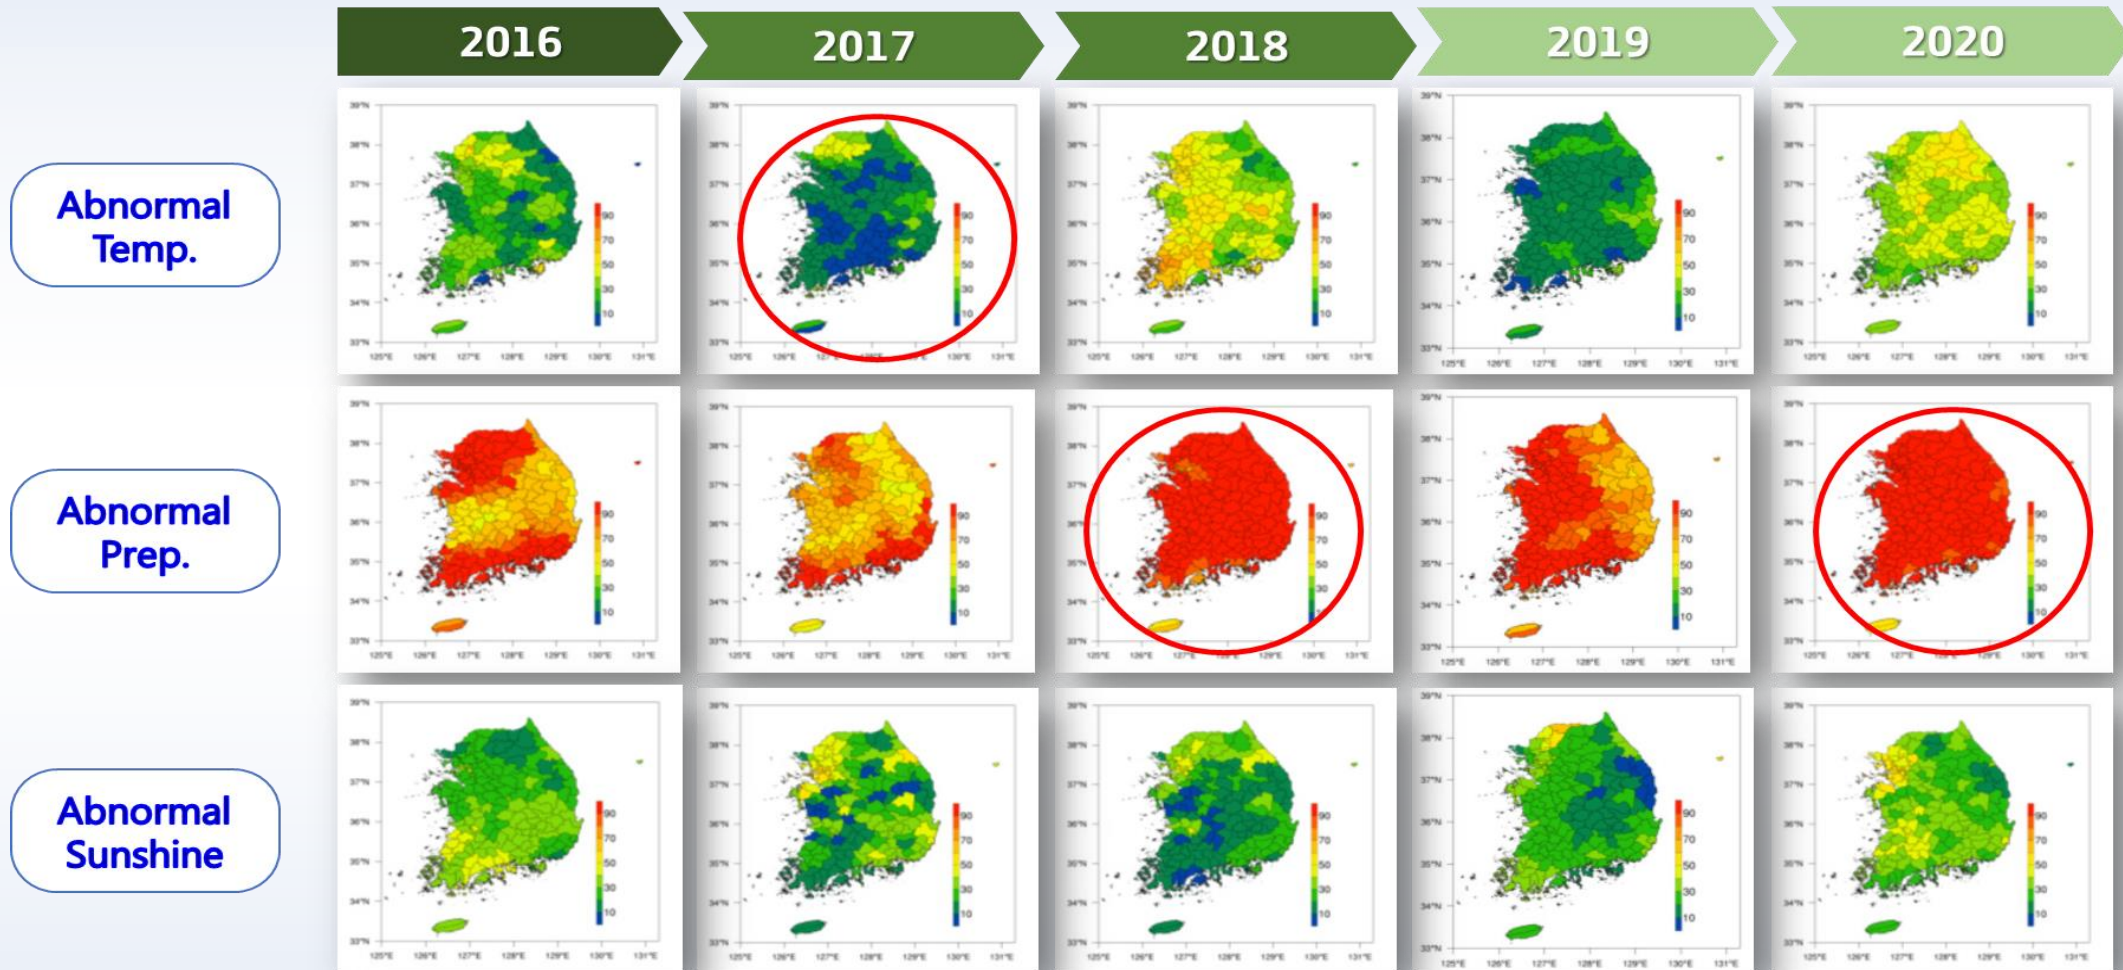

농업분야 기후변화 실태조사 및 영향·취약성 평가 종합보고서			CONTENTS
제1장. 개요			1
	1. 배경 및 목적		3
	2. 실태조사 및 영향·취약성 평가 방법 요약		4
	3. 조사결과 요약		15
제2장. 기후변화 실태조사 및 영향·취약성평가 결과			31
I	기후변화량		33
가상·기후 이상 변화	2. 기후생산력지수		45
II	농작물 적지 한계선 이동		56
식량·원예 작물 적지 및 생산성 변화	2. 농작물 적응-비적응 생산량 변화율		106
	3. 농작물 저온 요구도		148
	4. 농작물 기후신물종 재배면적		185
	5. 아열대작물 재배면적		200
III	가축 스트레스지수		213
가축의 생산성 변화	2. 가축 생산성 변화량		229
IV	비례병해충밀도 및 보독변동률		267
돌발 및 외래병해충-잡초 이상 발생 및 피해	2. 남방계해충 월동율		282
	3. 돌발병해충 확산 면적 및 피해율		290
V	생물다양성		341
생물다양성 및 생물계절 변화	2. 생물계절		355
	3. 꿀벌 월동기간 및 밀원식물 개화시기 변동		369
VI	토양침식 위험성		384
환경영향	2. 양분유출		395
	3. 농업용수 수질		418

	1. 이상기상 발생 횟수		435
	2. 논작물 피해량		447
	3. 밭작물 피해량		459
	4. 과수작물 피해량		472
	5. 사설작물 피해량		484
	6. 대가축 피해량		491
	7. 중소가축 피해량		494
	8. 초지(사료작물) 피해량		509

\*\* For coping with climate change in Korea, we have been established law relation to survey, assessment and evaluation of vulnerability in agricultural sector.

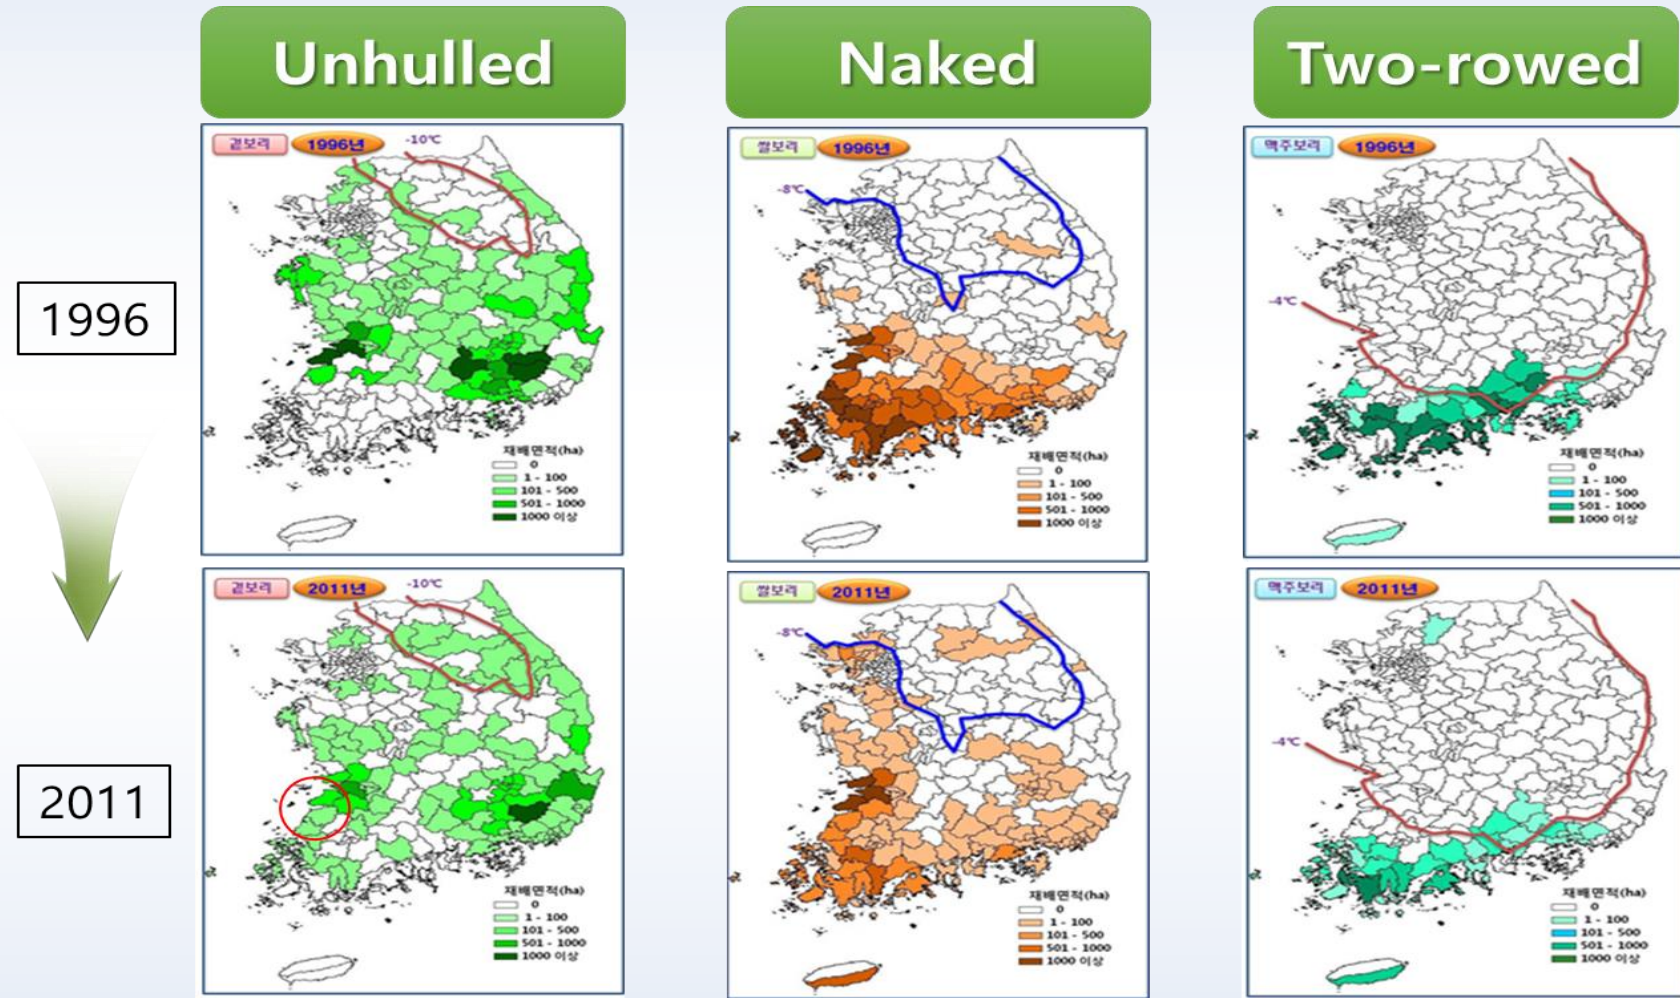

So after 5 years for law implementation, their results about climate change survey had been published last year. In Korean. This figures are cover and contents pages.

# Distribution of times of abnormal climate occurrences

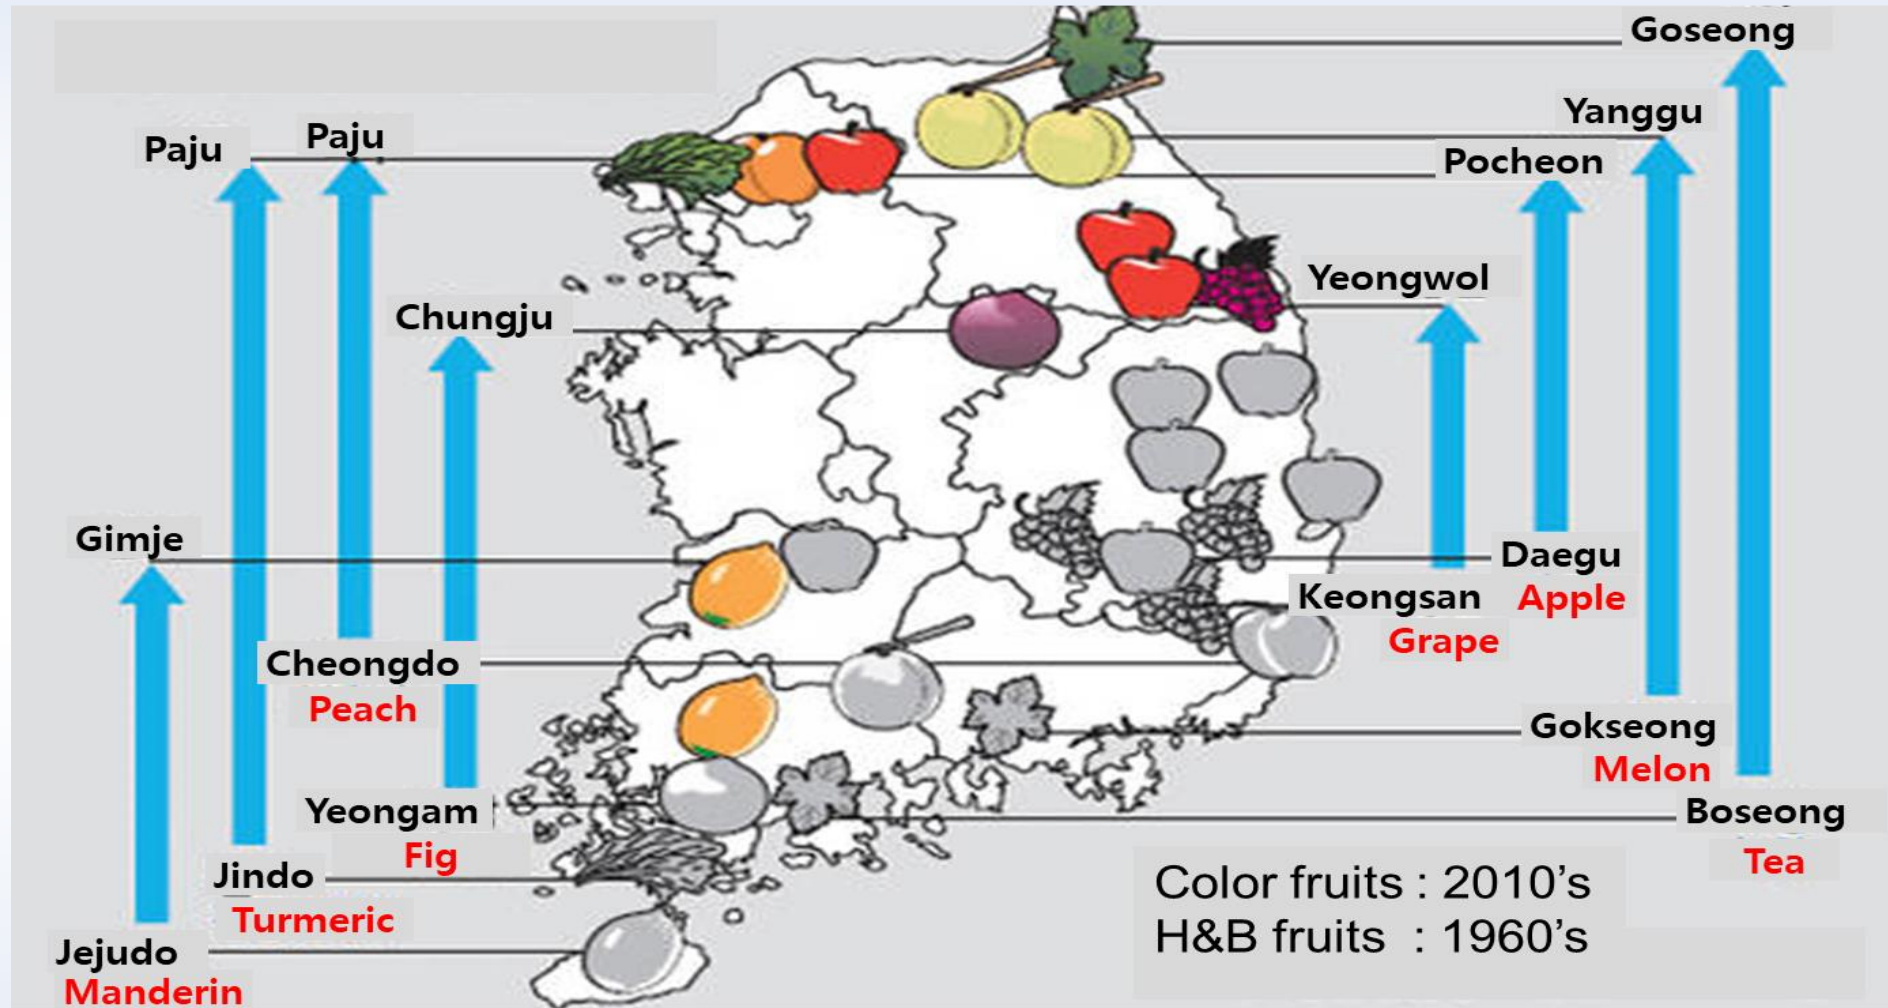

\*\* As I said previously, there are many abnormal climate. We have monitoring weather and climate data locally and in detail against temp. Prep, sunshine, and etc.  
The trends of ab. Temp, ab. Prep, and disaster in every year have been differently expressed according to local regions.

# Changes of cultivated area of kinds of barely

\*\* Since we have monitored area cultivated barley in 1996, some kinds of barley moved to north as this map. It is obvious that Korean peninsular has been warming rapidly. So we are paying attention fast warming at winter season because this trend might be give us new opportunity.

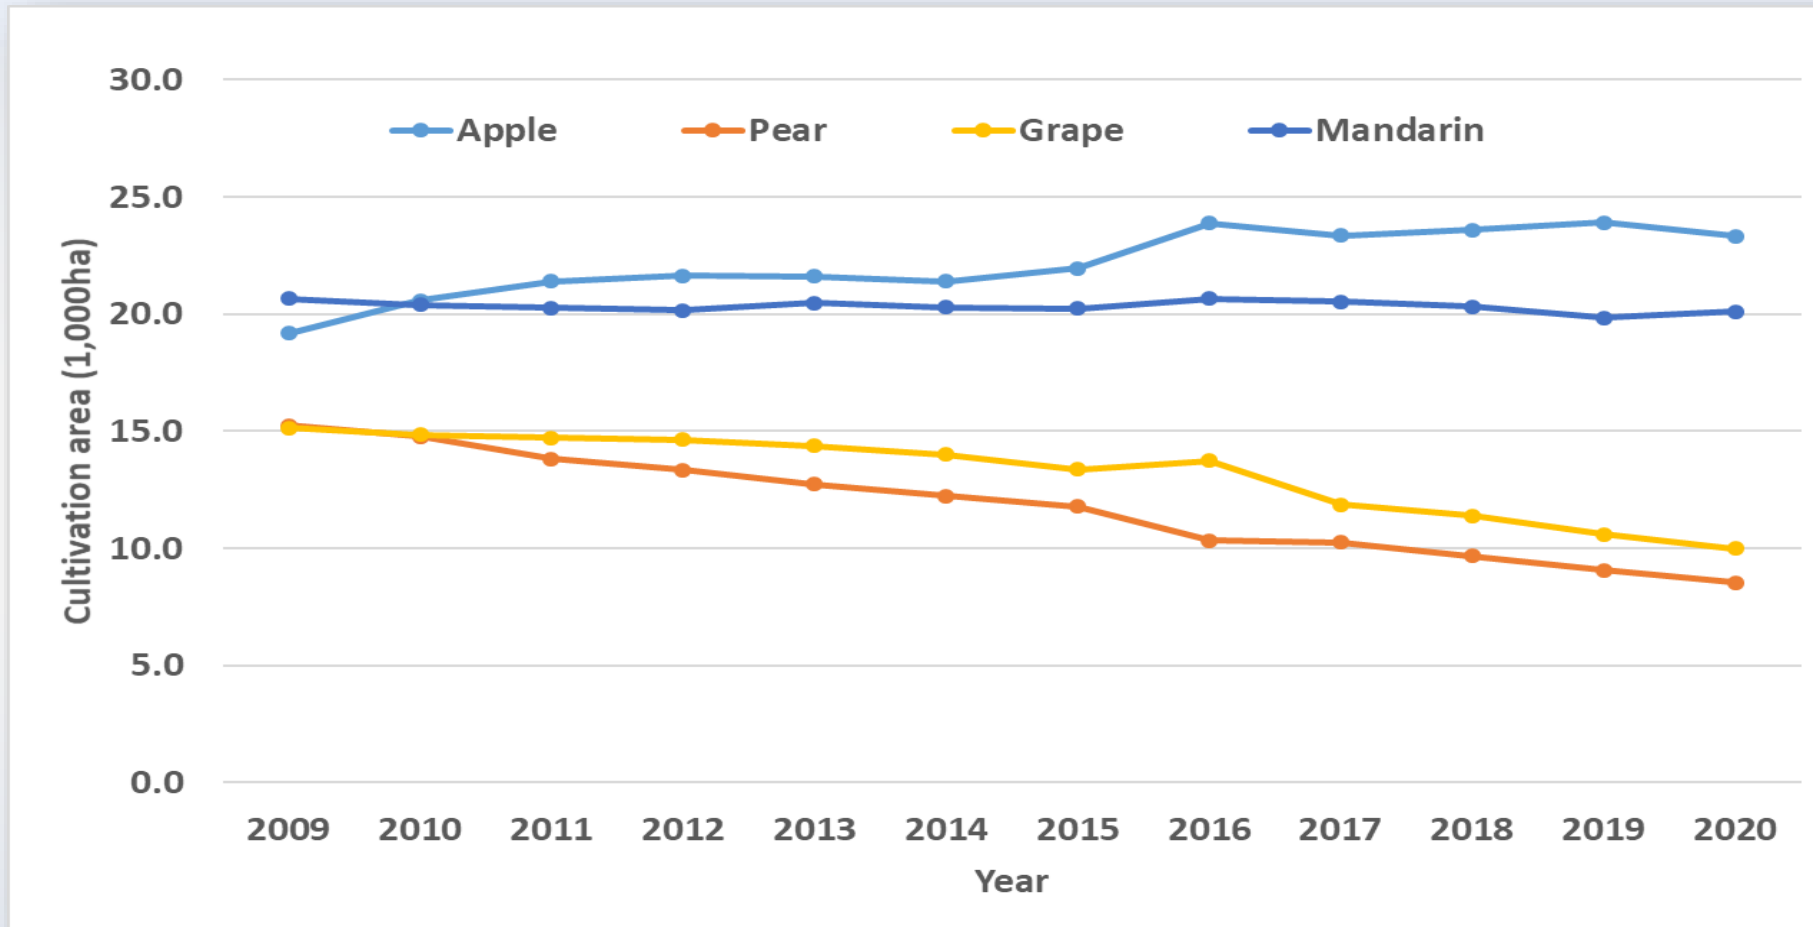

# Changes of cultivated area for major kinds of fruits

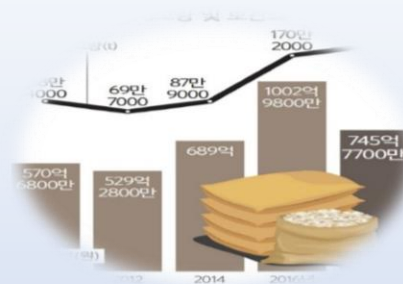

\*\* Most of fruit including apple, grape, peach, mandarin and etc. has been moved toward north area as this figure shows.

We have to prepare adaptation technology in fields of breeding, cultivation, cropping system in north area.

# Changes in cultivated area in 2020 compared to 2009

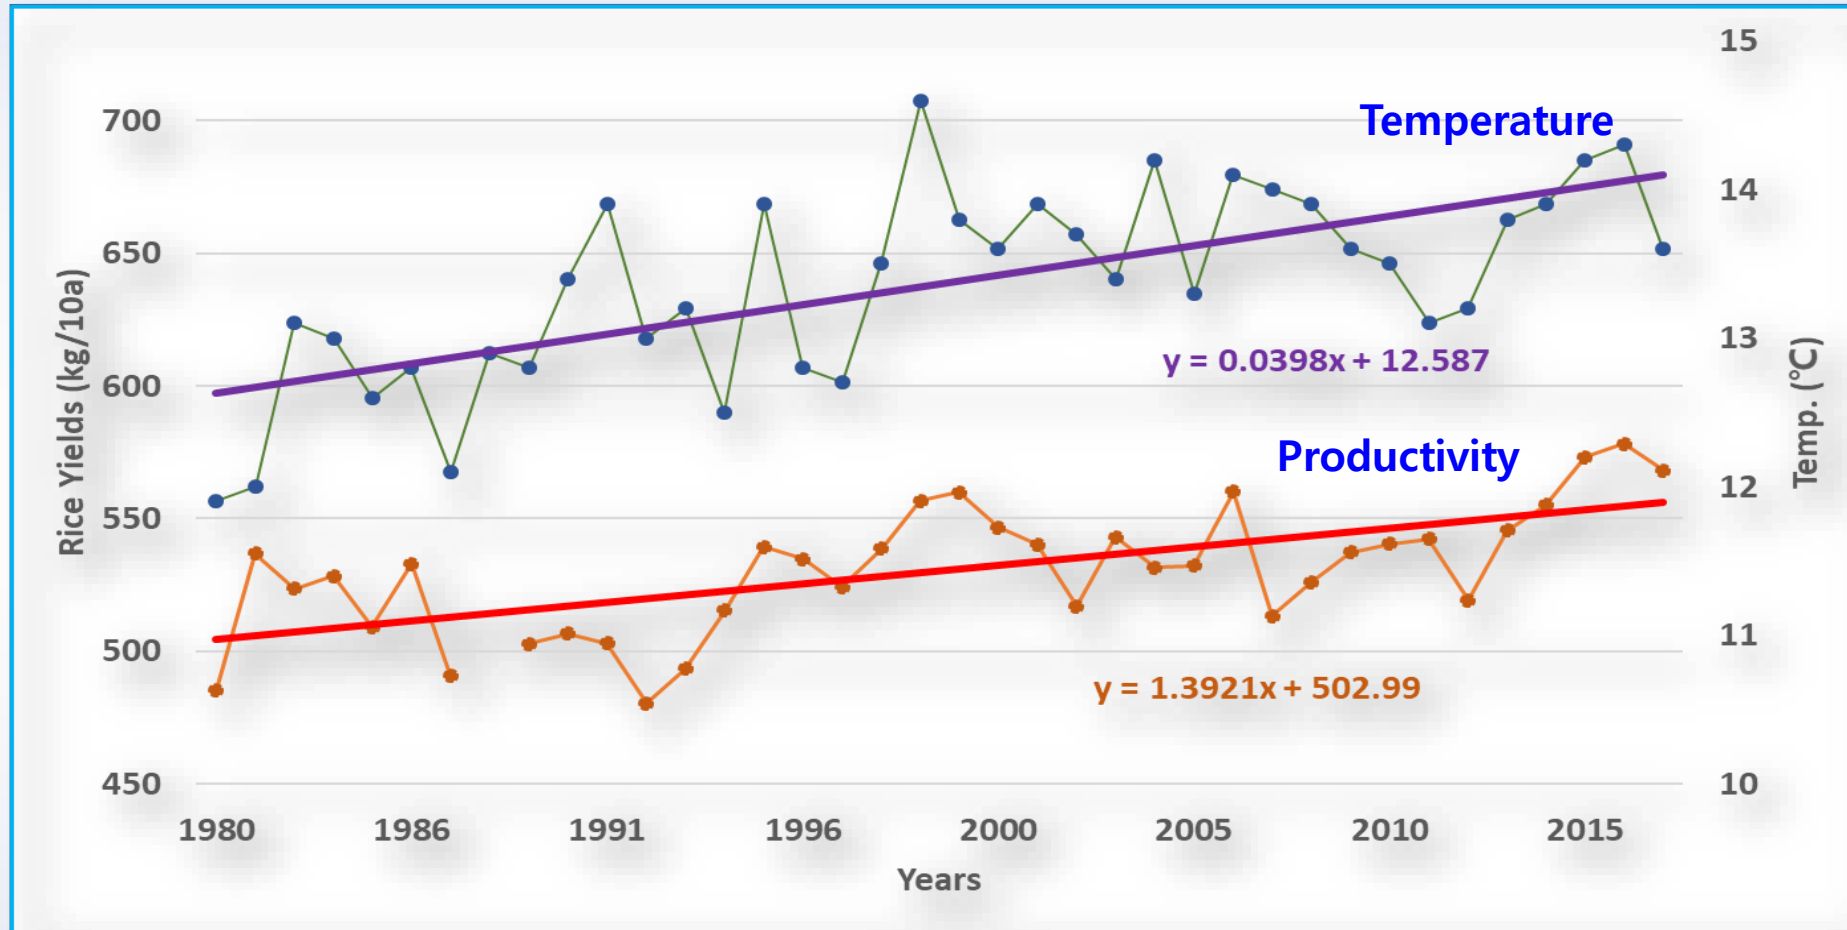

\*\* Except climatic factor, there are another factors to contribute production variability in agricultural production. Representative examples are here. Since in 2009, the area grape and pear has been decrease continuously but apple and mandarin sustained or increased a little. We evaluated that grape was affected by FTA in agricultural sector, and pear was changed customer preference. So we has to consider all of factors for coping with climate change in agricultural sector.

\*\* 1980 이후 밥쌀용 품종개발은 온도 증가에 대응하여 지속적으로 이루어지고 있으며 수량성도 개선되고

# Development of rice varieties according to Temp. increase

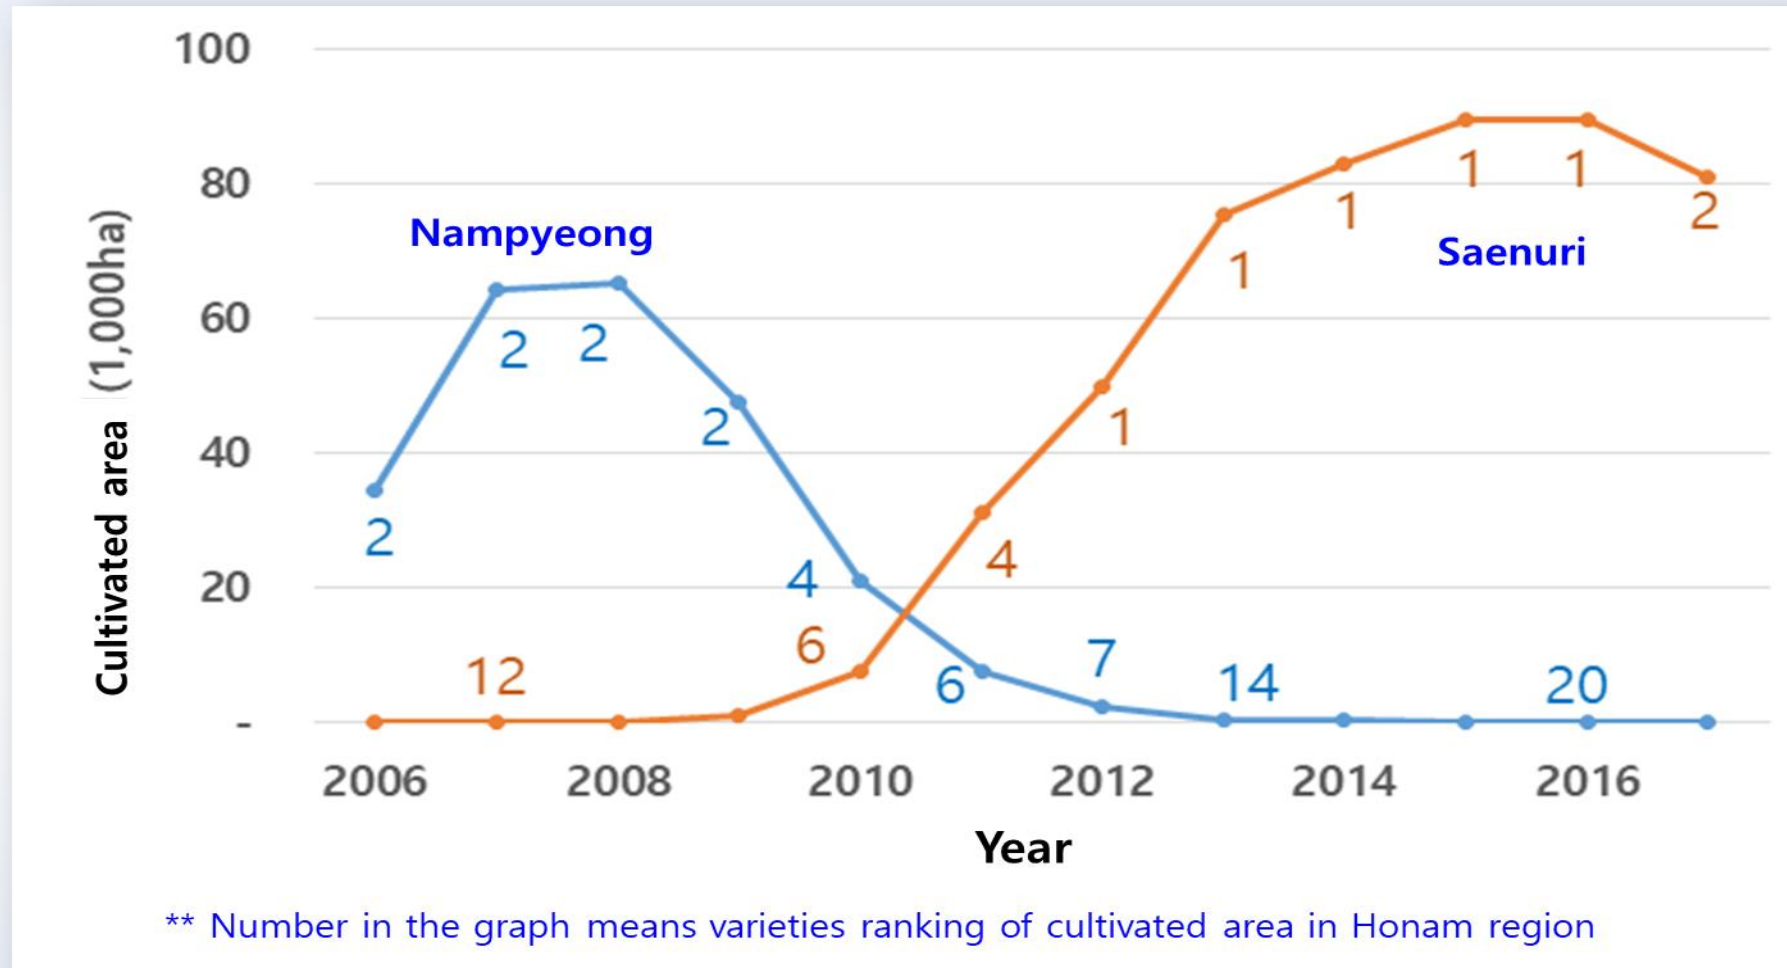

\*\* Rice is most important crop in Korea. So we continuously tried to develop new rice varieties in point of view productivities and qualities.

This figure shows changes of average temp. and average productivities of edible rice varieties developed. It seems that slopes of two curves are very similar.

It means that rice production against climate change has been adapted as productivity slightly and continuously increase.

# Change of farm rice varieties according to disease, bacterial blight

\*\* Here's adaptation example as rice variety has replaced due to emergence new race of bacterial blight.  
New variety Saenuri which have new resistance gene against bacterial blight has rapidly replaced old variety Nampyeong which is sensitivity to new race, since new race of bacterial blight has been spread out at Honam area.

\*\* 중부지방(주원)에서 옥수수 2기작이 가능하며 2번째 재배의 경우 봄재배 대비 재배일수가 약 15일 단축

# Development of double cropping cultivation of corn

('16, NICS)

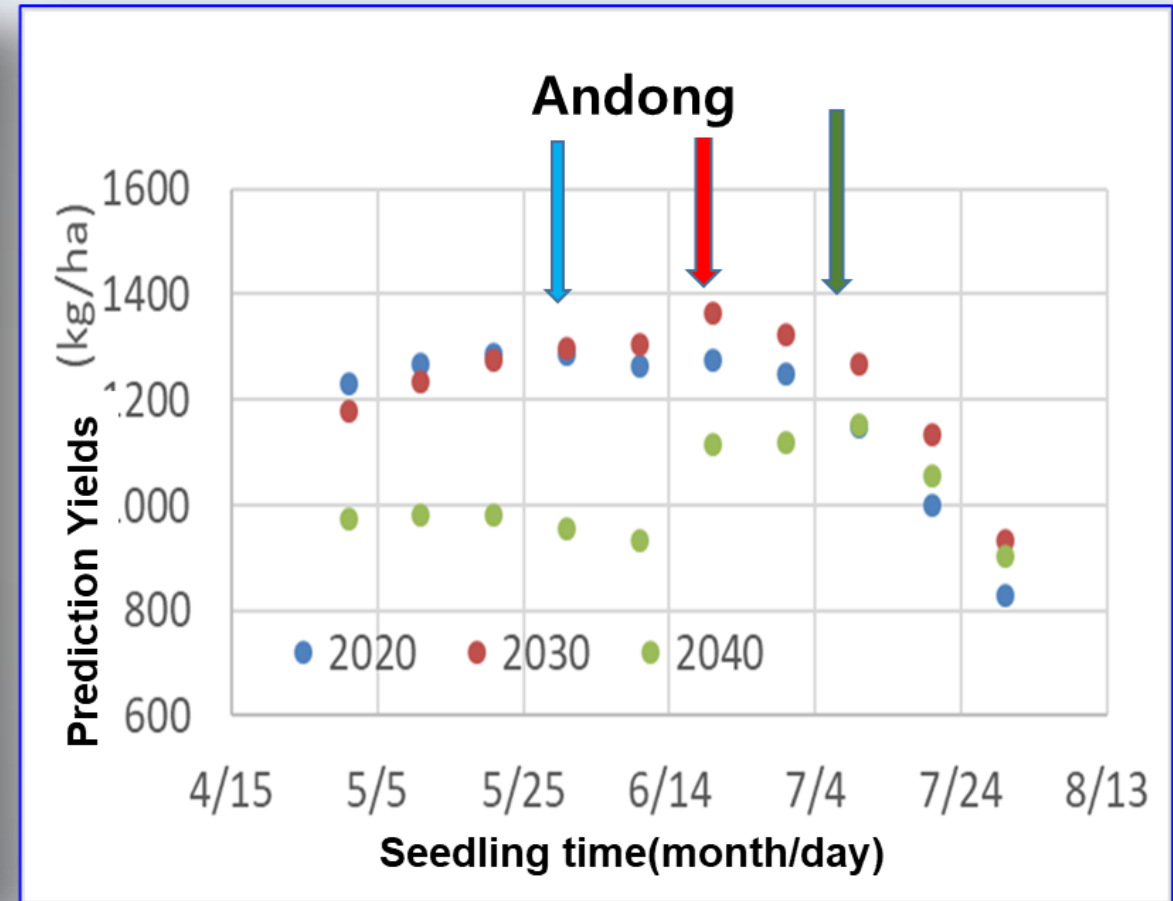

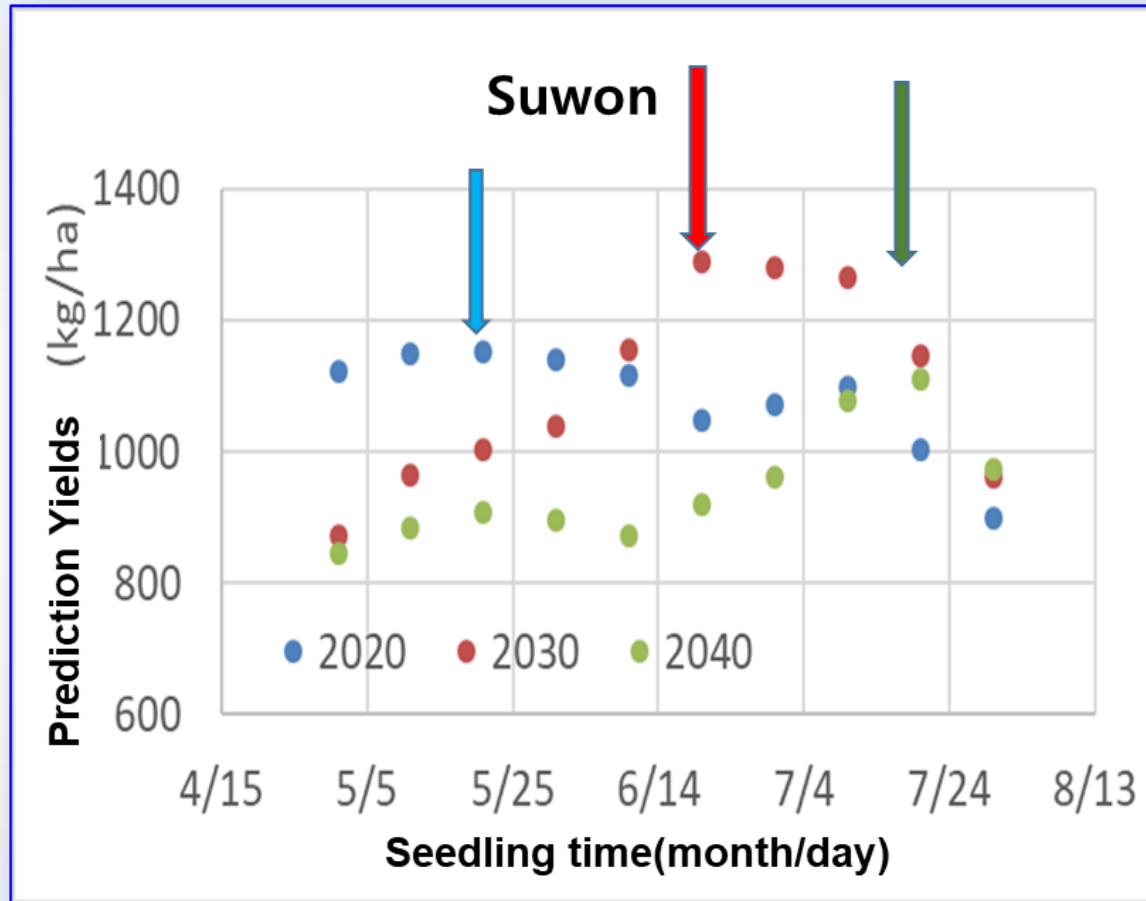

Methods	Periods od edible corn cultivation			Seedling-harvest (Days)
Spring Cultivation	← <b>Seedling</b> (4.10)	→ <b>Emerging ear</b> (6.25~30)	→ <b>Harvest</b> (7.20~25)	100~105
Autumn Cultivation		← <b>Seedling</b> (7.20~25)	→ <b>Emerging ear</b> (9.10~15) <b>Harvest</b> (10.20~25)	85~90

\*\* We also developed double cropping cultivation technology of corn in middle-north region as you see this slide. Spring cultivation is general cultivation. But autumn cultivation is not recommended due to periods of growth and its low productivity. As warming continues, it is possible to product about 90 to 95% of yields and decrease periods of growth when new technology is applied.

\*\* 수원, 안동 지역의 경우 2030년대에는 6월 하순 파종이 유리할 것으로 전망, 2040년대에는 7월이후 파종이 적합

# Prediction for changes of proper seedling time of soybean

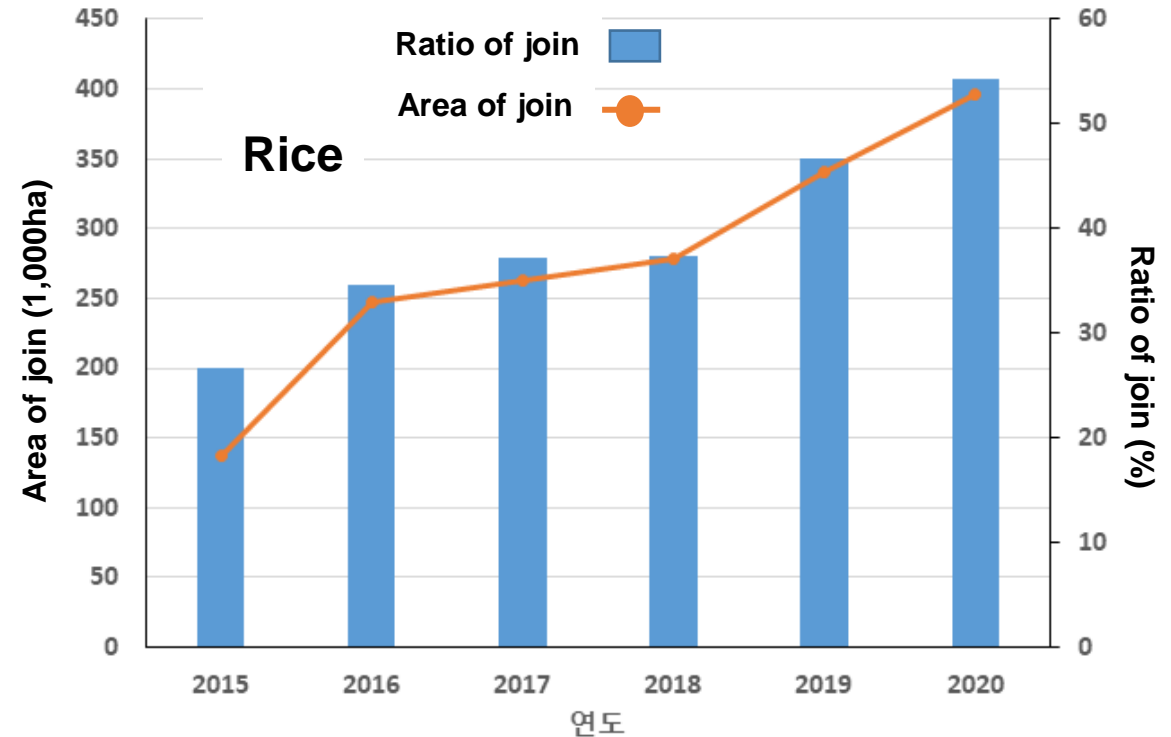

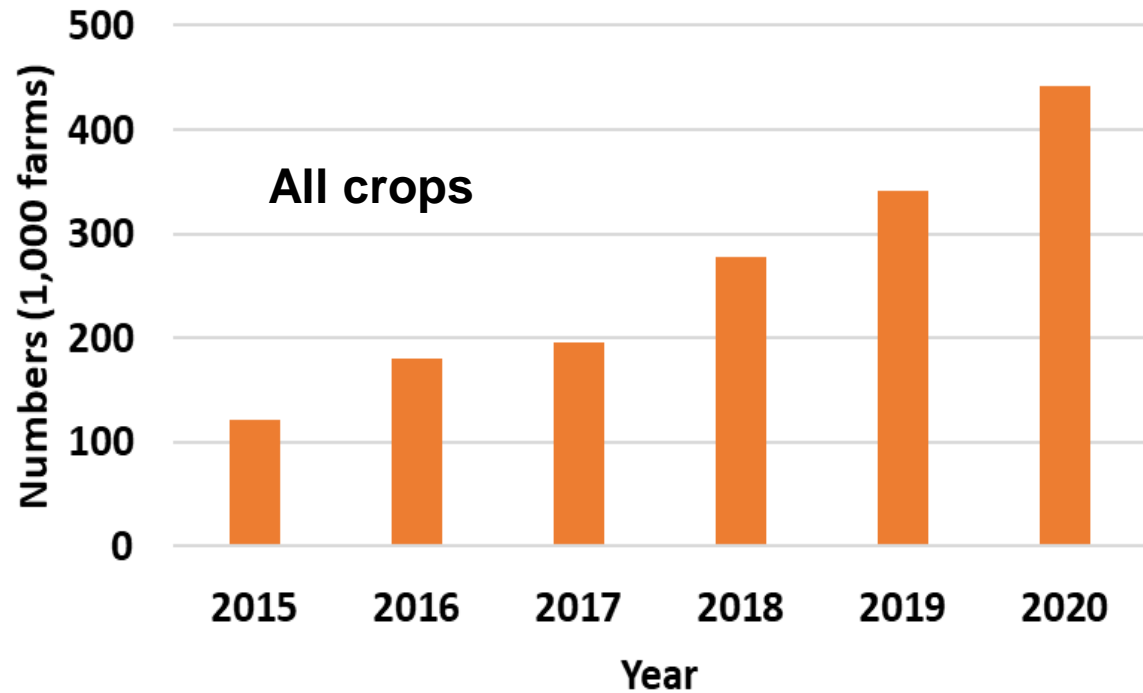

\*\* The technology of simulation of soybean was introduced to predict and define optimum seeding periods in the future.

As you see the two figures with two regions, proper seedling time predicted to be delayed in 2030's and 2040's compared with present time at all of regions.

So we has to prepare development of technology for moving seedling time locally to sustainable pricution.

# Insurance for damage due to climate disaster

\*\* Introduction with political and legal implementation is also important to coping with climate change. Since crop disaster insurance has been introduced in 2013, the numbers of kinds of crops have been gradually increased from 54 crops in 2013 to 67 crops in 2017. Farmers joined have been continuously increased like left figure. Especially, the ratio of joined farmers has been over 50% in 2020.

# Early warning system against climate disaster

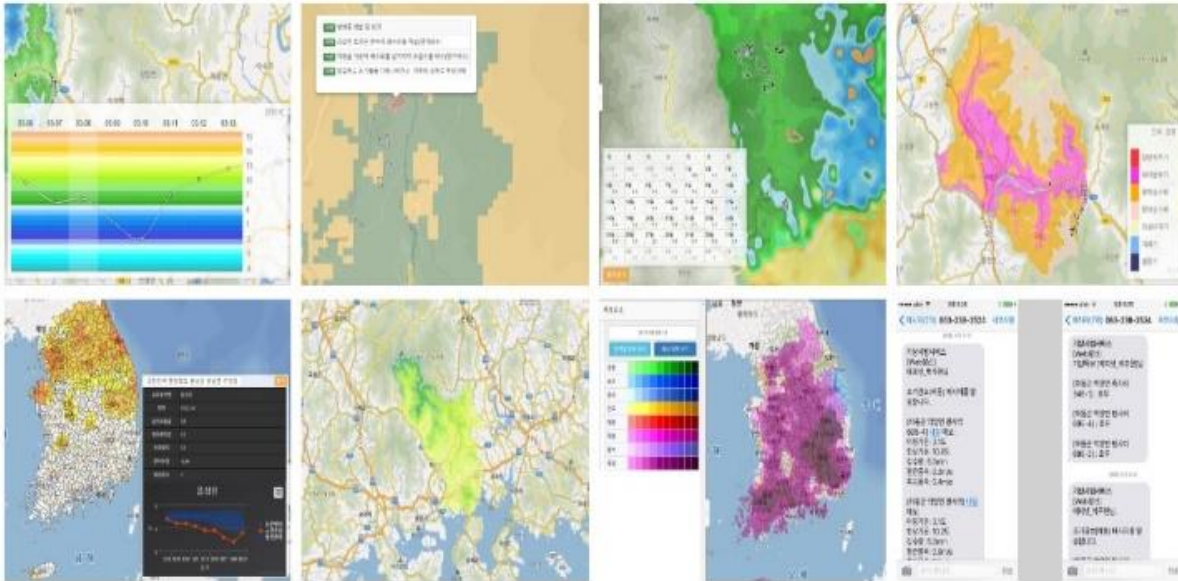

농촌진흥청 국립농업과학원 농업기상재해 조기경보시스템

## 농업기상재해 조기경보 시스템

시군 및 주산지 단위 서비스

# 아래와 같은 연구대상 지역의 자원농가에 대하여  
재해위험을 실시간으로 산출하여 인터넷과 스마트폰을 통해 실시간에 예보해주는 서비스를 제공합니다.

곡성	광양	구례	남원	순창	순천	임실
장수	진안	여흥	고창	군산	김제	무주
부안	원주	익산	전주	정읍	담양	보성
	장흥	함양	하순			

**농장 날씨**  
필지별로 아침기온, 한낮기온, 강우량, 풍속, 일사 등에 대하여 최대 8일의 예보를 제공하고 있습니다.

**농장재해**  
필지별로 저배종인 작목에 대한 재해 정보를 비롯하여 이에 대응 할 수 있는 지침을 제공하고 있습니다.

**전국기상위험**  
약 800개 유역별로 가뭄, 일조부족, 냉해 등의 재해 정보를 제공하고 있습니다.

**전국기상특보**  
약 800개 유역별로 한파, 폭설, 태풍 등의 기상 특보 상황을 제공하고 있습니다.

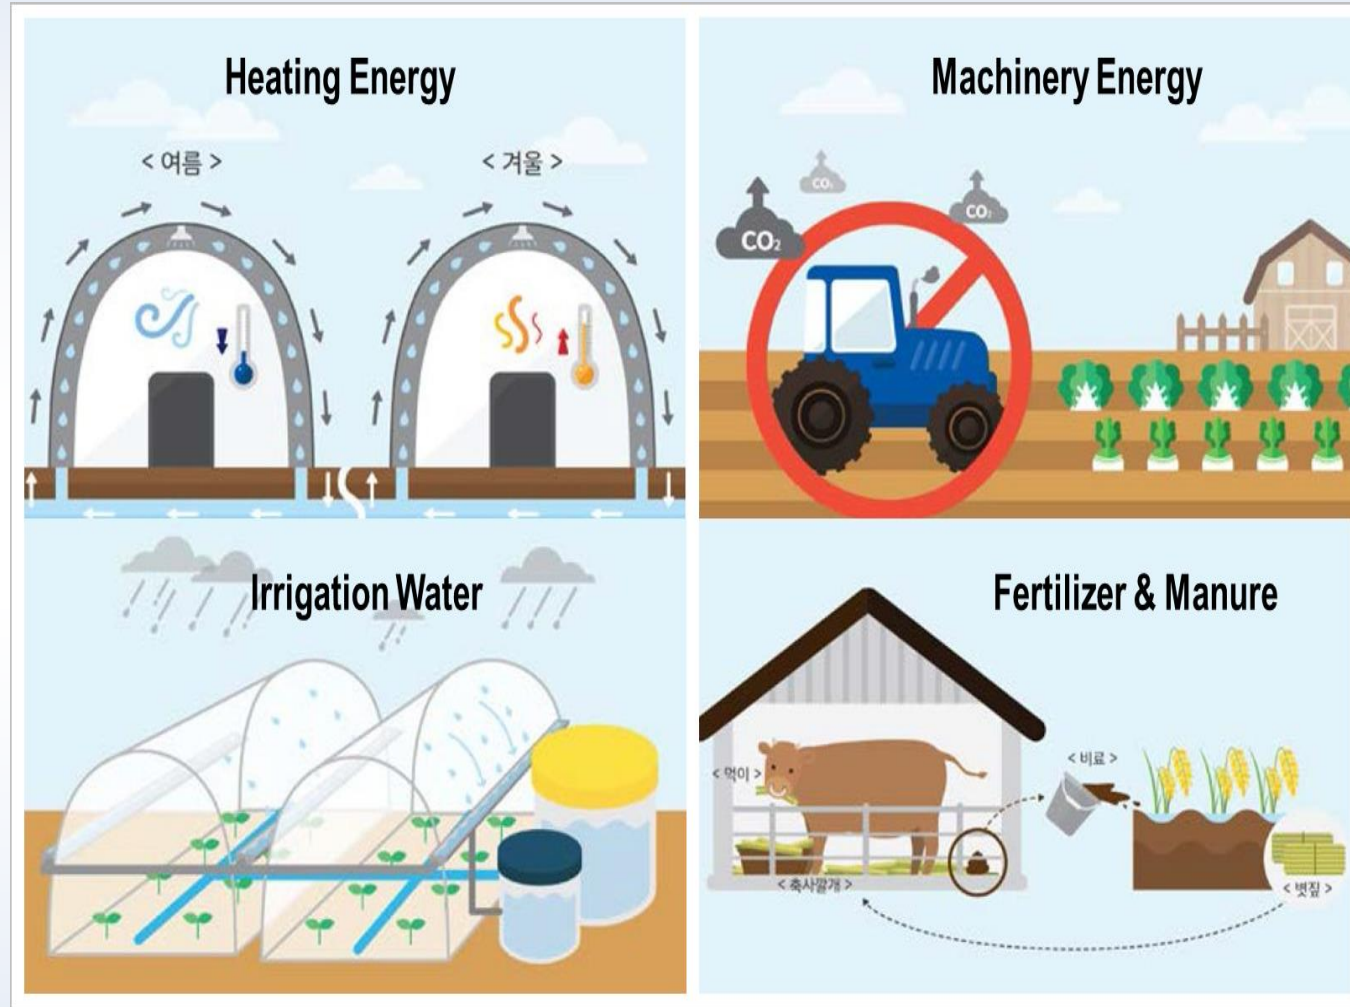

**자원농가 관리**  
각 시군 및 주산지 사이트 담당자 및 운영자들의 자원 농가들 관리, 운영 서버 관리를 지원할 수 있도록 준비중입니다.

**휴대전화 알림**  
날씨, 농장재해 상황을 매일 알림. 유역 단위의 기상 특보 내역을 수시 일괄으로 제공하고 있습니다.

\*\* As we mentioned previously, there are many weather disasters every year. To reduce damage, it's very important for farmers to get the information of weather and disaster occurrence as fast as they can. So we have established system, called early warning system against agricultural climate disasters, and provide internet and mobile service including present and forecast weather in farm scale, national weather breaking news, and mobile alarm.

# Certification for low carbon products

\*\* Another supporting system is certification for low carbon products. The items for getting certification are consisted of saving heating energy, machinery energy, efficient use of irrigation water, reducing fertilizer and manure and etc. farmers who have been obtained certification could receive low carbon labeled marker which can attach their product to have merit to sell.

# Establishing 'carbon offset scheme' for voluntary reduction of GHG emission

**Registration → Certification reduction → Payment incentive**  
~10\$/1t CO<sub>2</sub>-eq

\*\* To expand benefit for farmers, we added another system called 'carbon offset scheme' which is to pay directly to farmers who are certified carbon reduction instead of giving low carbon label. Payment incentive is about 10\$/1t co<sub>2</sub>-eq. It seems not to be much.

# Implement of demonstration project for reducing methane in paddy

5월 30일 이상, 중만생종													
날짜	5월	6월	7월	8월	9월	10월	11월	12월	1월	2월	3월	4월	5월
재배단계	벼재직	이앙	활착기	분얼기	최고분얼기	무효분얼기	유수형성기	수잉기	출수기	통숙기	통숙후기		
저탄소 (4주)	최고	수동	4	7	0		4	2	무관개				
	최저	수동	2	4	-10		2	-3	무관개				
	기간		7	30	28		26	25	30				
저탄소 (3주)	최고	수동	4	7	0		4	2	무관개

관행 (2주)	최고	수동	4	7	0		4	2	무관개				
	최저	수동	2	4	-10		2	-3	무관개				
	기간		7	30	14		40	25	30				
물관리 (상시양수)	최고	수동	4	7			4	2	무관개				
	최저	수동	2	4			2	-3	무관개				
	기간		7	30			54	25	30				

Low carbon irrigation schedule

Automatic irrigation gate

Mobile gate control app

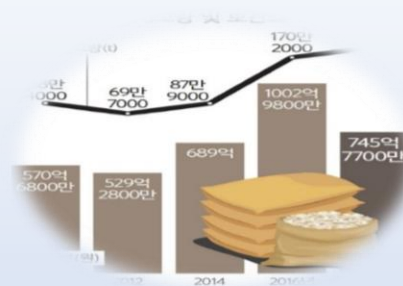

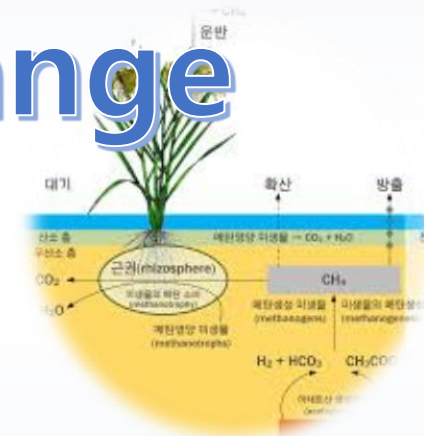

Methane chamber

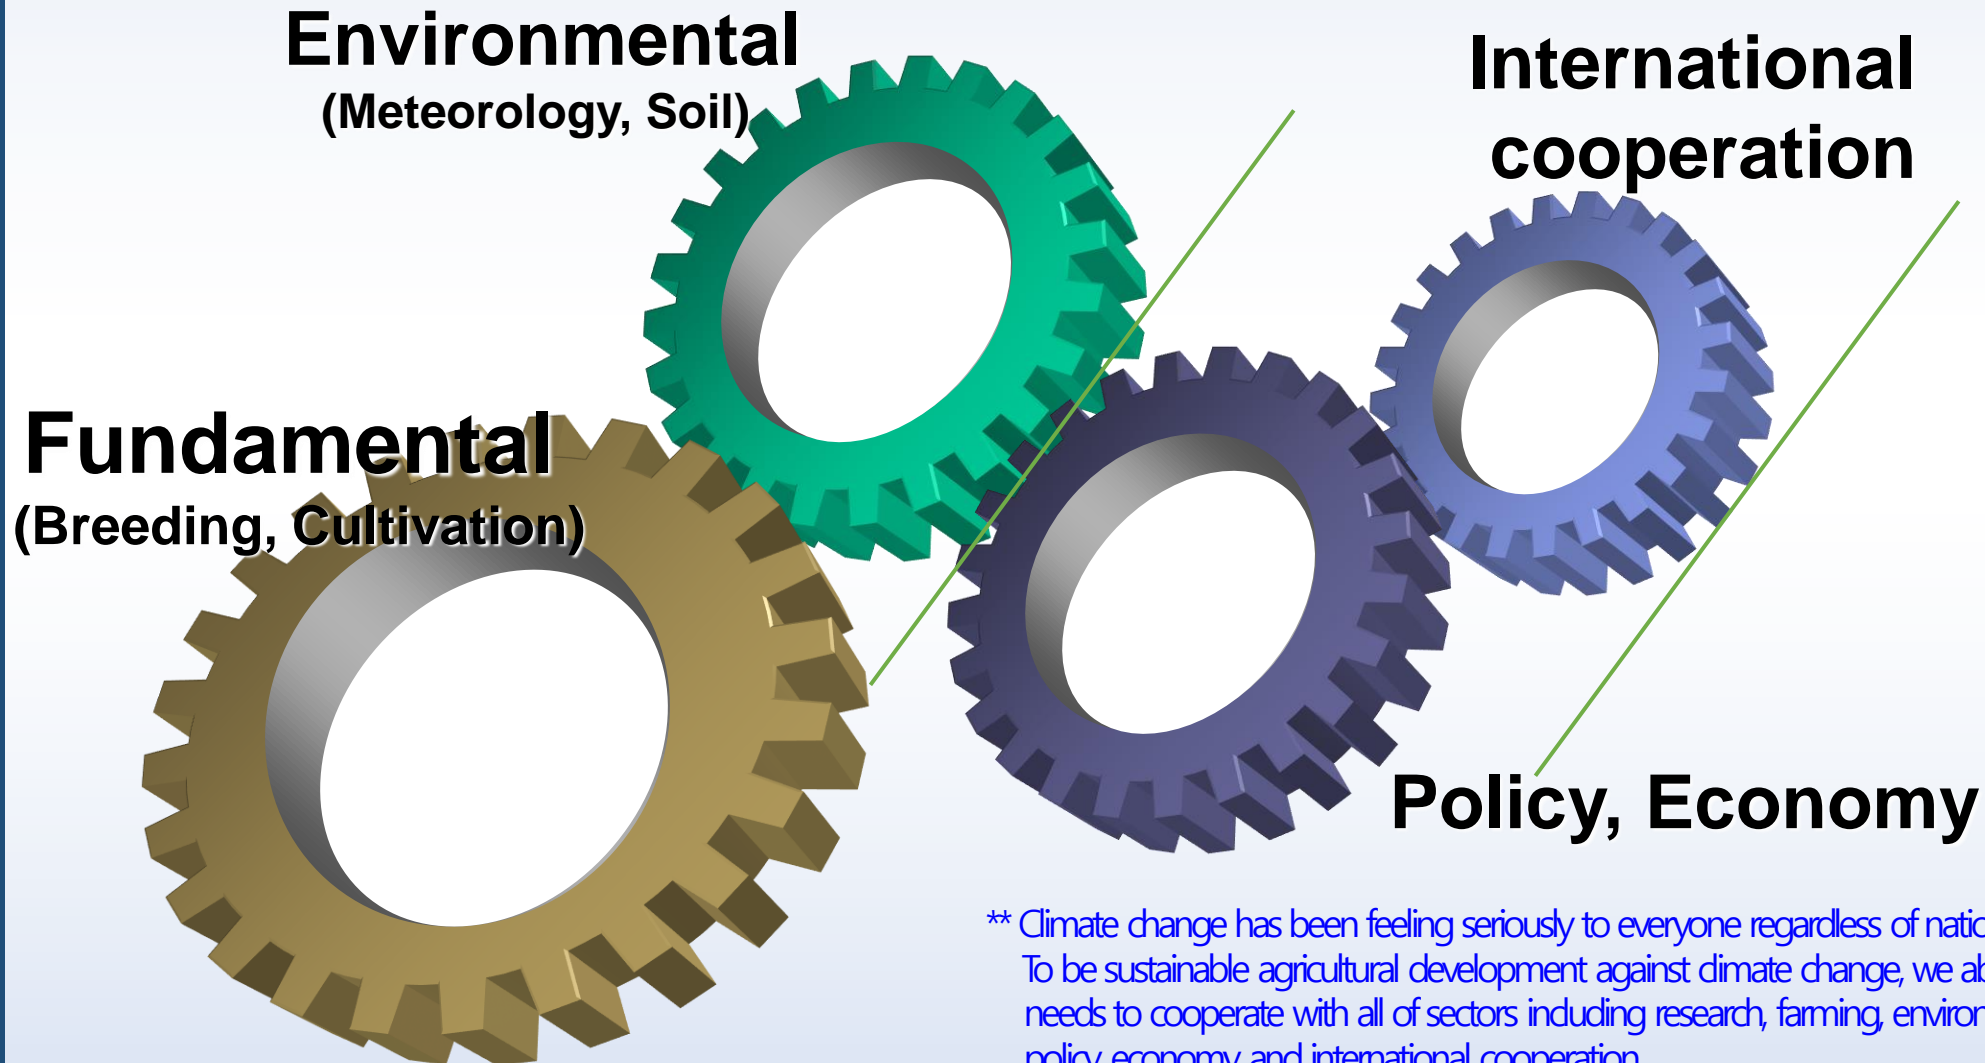

\*\* We have been carrying out demonstration project on increase intermittent irrigation in paddy fields for reducing methane emission at several legions. To getting related data and making easy management irrigation, we developed and applied remote control automatic irrigation gate in the base of mobile system. By using this automatic gate, we could be understand and measured how to manage irrigation schedule without productivity and with reduction emission.

## IV. Future against Climate Change

# Organic integration with all of fields for responding climate change

**\*\* Climate change has been feeling seriously to everyone regardless of nationality. To be sustainable agricultural development against climate change, we absolutely need to cooperate with all of sectors including research, farming, environment, policy, economy, and international cooperation.**

# Thank you
